**Abstract:** While traditional life-history parameters (mean life span, age at maturity, etc.) have been used to study life-history evolution, there is a need for more sophisticated methods. We have developed a new method for analyzing life-history data. We use a life-table approach to estimate the probability of survival to a given age, and then use a life-table approach to estimate the probability of survival to a given age. This method is more powerful than traditional life-history parameters because it allows us to estimate the probability of survival to a given age, and then use a life-table approach to estimate the probability of survival to a given age. This method is more powerful than traditional life-history parameters because it allows us to estimate the probability of survival to a given age, and then use a life-table approach to estimate the probability of survival to a given age.
