Cricket as a Model Organism Hadley Wilson Horch, Taro Mito, Aleksandar Popadić, Hideyo Ohuchi, Sumihare Noji, 2017-01-09 This book covers a broad range of topics about the cricket from its development regeneration physiology nervous system and behavior with remarkable recent updates by adapting the new sophisticated molecular techniques including RNAi and other genome editing methods It also provides detailed protocols on an array of topics and for basic experiments on the cricket While the cricket has been one of the best models for neuroethological studies over the past 60

years it has now become the most important system for studying basal hemimetabolous insects The studies of *Gryllus* and related species of cricket will yield insight into evolutionary features that are not evident in other insect model systems which mainly focus on holometabolous insects such as *Drosophila* *Tribolium* and *Bombyx* Research on crickets and grasshoppers will be important for the development of pest control strategies given that some of the most notorious pests also belong to the order Orthoptera At the same time crickets possess an enormously high food conversion efficiency making them a potentially important food source for an ever expanding human population This volume provides a comprehensive source of information as well as potential new applications in pest management and food production of the cricket It will inspire scientists in various disciplines to use the cricket model system to investigate interesting and innovative questions

Research Awards Index ,1981 **Cumulated Index Medicus** ,1997 *New Scientist* ,2000 *Nerve Cells and Insect Behavior* Kenneth David Roeder,1967 The strike of a praying mantis s forelegs is so fast that once they are set in motion the mantis cannot control its aim How does it ever manage to catch a fly A moth negotiating the night air hears the squeak of a hunting bat on the wing and tumbles out of harm s way How Insects are ideal subjects for neurophysiological studies and at its simplest level this classic book relates the activities of nerve cells to the activities of insects something that had never been attempted when the book first appeared in 1963 In several elegant experiments on the moth the cockroach and the praying mantis Roeder shows how stimulus and behavior are related through the nervous system and suggests that the insect brain appears to control behavior by determining which of the various built in activity patterns will appear in a given situation This slim volume remains invaluable to an understanding of the nervous mechanisms responsible for insect behavior

Nervous Systems and Control of Behavior Charles Derby,Martin Thiel,2014-09-24 Crustacean Nervous Systems and their Control of Behavior is the third volume of the series The Natural History of the Crustacea This volume is on the functional organization of crustacean nervous systems and how those nervous systems produce behavior It complements other volumes on related topics of feeding biology reproductive biology endocrine systems and behavioral ecology There is a rich history of the study of the neurobiology of crustaceans going back over 150 years This has included studies on how their nervous systems allow them to perform behaviors that are adapted to their particular environments as well as studying them as model organisms to understand basic biomedical principles about neural function such as sensory transduction and processing synaptic transmission and integration neuromodulation and learning and memory The volume has three sections that build progressively on each other The first section is on the basic organizational features of the crustacean nervous system and the principles upon which it is built The second section is on sensory ecology the organization of each sensory system and how it is used in intra and interspecific interactions within an ecological context The third section uses case studies of how crustacean nervous systems are organized to perform complex behaviors and interactions such as walking escape social interactions and memory and learning Taken together the 20 chapters synthesize our modern understanding of the neural

control of behavior in crustaceans based on the most recent technologies in physiological recording molecular biology and computational science This volume will be useful to students and researchers as a concise summary of current knowledge of crustacean neuroscience Nerve cells and insect behavior Kenneth D. Behaviour Peter Simmons,David Young,2010-05-27 An extensively revised third edition of this introduction to neuroethology the neuronal basis of animal behaviour for zoology biology and psychology undergraduate students The book focuses on the roles of individual nerve cells in behaviour from simple startle responses to complex behaviours such as route learning by rats and singing by crickets and birds It begins by examining the relationship between brains and behaviour and showing how study of specialised behaviours reveals neuronal mechanisms that control behaviour Information processing by nerve cells is introduced using specific examples and the establishing roles of neurons in behaviour is described for a predator prey interaction toads versus cockroaches New material includes vision by insects which describes sensory filtering hunting by owls and bats which describes sensory maps and rhythmical movements including swimming and flying which describes how sequences of movements are generated Includes stunning photographs which capture the detail of the behaviour **Nerve**

Cells and Animal Behaviour Peter Simmons,David Young,2010-05-27 An extensively revised third edition of this introduction to neuroethology the neuronal basis of animal behaviour for zoology biology and psychology undergraduate students The book focuses on the roles of individual nerve cells in behaviour from simple startle responses to complex behaviours such as route learning by rats and singing by crickets and birds It begins by examining the relationship between brains and behaviour and showing how study of specialised behaviours reveals neuronal mechanisms that control behaviour Information processing by nerve cells is introduced using specific examples and the establishing roles of neurons in behaviour is described for a predator prey interaction toads versus cockroaches New material includes vision by insects which describes sensory filtering hunting by owls and bats which describes sensory maps and rhythmical movements including swimming and flying which describes how sequences of movements are generated Includes stunning photographs which capture the detail of the behaviour From Attention to Goal-Directed Behavior Francisco Aboitiz,Diego Cosmelli,2008-11-21 Attention is a key psychological construct in the understanding of human cognition and the target of enormous efforts to elucidate its physiological mechanisms as the wealth of literature both primary and secondary attests for recent compilations see Itti Rees Paletta Posner 2004 But in addition to asking what attention actually is decomposing and analyzing its varieties or delimiting its neurobiological mechanisms and effects in this volume we want to explore attention somewhat differently We believe that a full fledged theory of attention must consider its workings in the context of motivated goal directed and environmentally constrained organisms That attention is related to goal directed behavior is not news What the contri tions to this volume do suggest however is the existence of fundamental links between attention and two key processes that are crucial for adapted conduct go directed behavior and cognitive control Importantly they show that these

relations can be explored at multiple levels including neurodynamical neurochemical evolutionary and clinical aspects and that in doing so multiple methodological challenges arise that are worth considering and pursuing The reader will find here therefore a selection of contributions that range from basic mechanisms of attention at the neuronal level to developmental aspects of cognitive control and its impairments Another trend that will become evident is that in different ways the authors stress the need to understand these issues as they unfold in natural behavior both healthy and pathological thus arguing for a more ecological approach to these questions

Neuroscience of Rule-Guided Behavior Silvia A. Bunge, Jonathan D. Wallis, 2007-10-05 Neuroscience of Rule Guided Behavior brings together for the first time the experiments and theories that have created the new science of rules Rules are central to human behavior but until now the field of neuroscience lacked a synthetic approach to understanding them How are rules learned retrieved from memory maintained in consciousness and implemented How are they used to solve problems and select among actions and activities How are the various levels of rules represented in the brain ranging from simple conditional ones if a traffic light turns red then stop to rules and strategies of such sophistication that they defy description And how do brain regions interact to produce rule guided behavior These are among the most fundamental questions facing neuroscience but until recently there was relatively little progress in answering them It was difficult to probe brain mechanisms in humans and expert opinion held that animals lacked the capacity for such high level behavior However rapid progress in neuroimaging technology has allowed investigators to explore brain mechanisms in humans while increasingly sophisticated behavioral methods have revealed that animals can and do use high level rules to control their behavior The resulting explosion of information has led to a new science of rules but it has also produced a plethora of overlapping ideas and terminology and a field sorely in need of synthesis In this book Silvia Bunge and Jonathan Wallis bring together the worlds leading cognitive and systems neuroscientists to explain the most recent research on rule guided behavior Their work covers a wide range of disciplines and methods including neuropsychology functional magnetic resonance imaging neurophysiology electroencephalography neuropharmacology near infrared spectroscopy and transcranial magnetic stimulation This unprecedented synthesis is a must read for anyone interested in how complex behavior is controlled and organized by the brain
