Explanatory Item Response Models Byboeck:

Handbook of Modern Item Response Theory Wim J. van der Linden, Ronald K. Hambleton, 2013-03-09 Item response theory has become an essential component in the toolkit of every researcher in the behavioral sciences. It provides a powerful means to study individual responses to a variety of stimuli and the methodology has been extended and developed to cover many different models of interaction. This volume presents a wide ranging handbook to item response theory and its applications to educational and psychological testing. It will serve as both an introduction to the subject and also as a comprehensive reference volume for practitioners and researchers. It is organized into six major sections: the nominal categories model, models for response time or multiple attempts on items, models for multiple abilities or cognitive components, nonparametric models, models for nonmonotone items, and models with special assumptions. Each chapter in the book has been written by an expert of that particular topic and the chapters have been carefully edited to ensure that a uniform style of notation and presentation is used throughout. As a result, all researchers whose work uses item response theory will find this an indispensable companion to their work and it will be the subject's reference volume for many years to come.

A Short Guide to Item Response Theory Models Gerhard Tutz, 2025-08-02 This book presents foundational concepts, essential principles, and practical applications of Item Response Theory (IRT). It provides a structured survey of diverse models that have been put forth, emphasizing both their differences and commonalities. The main focus is on modern latent trait theory models which provide measurement tools that clearly separate between person abilities and item parameters. The topics covered include the binary Rasch model, its extensions, and alternative binary models, ordinal models and their extensions that account for response styles, the thresholds model, classical test theory response models for count data, differential item functioning, and explanatory item response models. Tree based item response models, typically not found in classical IRT textbooks, are also addressed. Applications of the models are illustrated on several data sets from differing areas, showing how models can be fitted and compared. All examples have been computed using R. Code snippets are provided and the full R code for most of the examples is available online. The book is aimed at graduate students, applied statisticians, and researchers working in psychometrics, educators, and anyone curious about modeling strategies that enhance the precision and validity of their measurement tools. It serves as an introductory guide for beginners while also providing a resource for those seeking an overview of the plethora of available IRT models.

Using Explanatory Item Response Models to Evaluate Complex Scientific Tasks Designed for the Next Generation Science Standards Tina Chiu, 2016 This dissertation includes three studies that analyze a new set of assessment tasks developed by the Learning Progressions in Middle School Science LPS Project These assessment tasks were designed to measure science content

knowledge on the structure of matter domain and scientific argumentation while following the goals from the Next Generation Science Standards NGSS The three studies focus on the evidence available for the success of this design and its implementation generally labelled as validity evidence I use explanatory item response models EIRMs as the overarching framework to investigate these assessment tasks These models can be useful when gathering validity evidence for assessments as they can help explain student learning and group differences In the first study I explore the dimensionality of the LPS assessment by comparing the fit of unidimensional between item multidimensional and Rasch testlet models to see which is most appropriate for this data By applying multidimensional item response models multiple relationships can be investigated and in turn allow for a more substantive look into the assessment tasks The second study focuses on person predictors through latent regression and differential item functioning DIF models Latent regression models show the influence of certain person characteristics on item responses while DIF models test whether one group is differentially affected by specific assessment items after conditioning on latent ability Finally the last study applies the linear logistic test model LLTM to investigate whether item features can help explain differences in item difficulties

Introduction to Item Response Theory Models and Applications James Carlson, 2020-10-12 This is a highly accessible comprehensive introduction to item response theory IRT models and their use in various aspects of assessment testing The

book employs a mixture of graphics and simulated data sets to ease the reader into the material and covers the basics required to obtain a solid grounding in IRT. Written in an easily accessible way that assumes little mathematical knowledge, Carlson presents detailed descriptions of several commonly used IRT models including those for items scored on a two-point dichotomous scale such as correct/incorrect and those scored on multiple-point polytomous scales such as degrees of correctness. One chapter describes a model in depth and is followed by a chapter of instructions and illustrations showing how to apply the models to the reader's own work. This book is an essential text for instructors and higher-level undergraduate and postgraduate students of statistics, psychometrics, and measurement theory across the behavioral and social sciences as well as testing professionals.

[Handbook of Polytomous Item Response Theory Models](#) Michael Nering, Remo Ostini, 2011-01-19

This comprehensive Handbook focuses on the most used polytomous item response theory (IRT) models. These models help us understand the interaction between examinees and test questions where the questions have various response categories. The book reviews all of the major models and includes discussions about how and where the models originated conceptually and in practical terms. Diverse perspectives on how these models can best be evaluated are also provided. Practical applications provide a realistic account of the issues practitioners face using these models. Disparate elements of the book are linked through editorial sidebars that connect common ideas across chapters, compare and reconcile differences in terminology, and explain variations in mathematical notation. These sidebars help to demonstrate the commonalities that exist across the field. By assembling this critical information, the editors hope to inspire others to use polytomous IRT models in their own research so they too can achieve the type of improved measurement that such models can provide.

Part 1 examines the most commonly used polytomous IRT models, major issues that cut across these models, and a common notation for calculating functions for each model. An introduction to IRT software is also provided. Part 2 features distinct approaches to evaluating the effectiveness of polytomous IRT models in various measurement contexts. These chapters appraise evaluation procedures and fit tests and demonstrate how to implement these procedures using IRT software. The final section features groundbreaking applications. Here the goal is to provide solutions to technical problems to allow for the most effective use of these models in measuring educational, psychological, and social science abilities and traits. This section also addresses the major issues encountered when using polytomous IRT models in computerized adaptive testing. Equating test scores across different testing contexts is the focus of the last chapter. The various contexts include personality research, motor performance, health, and quality of life indicators, attitudes, and educational achievement. Featuring contributions from the leading authorities, this handbook will appeal to measurement researchers, practitioners, and students who want to apply polytomous IRT models to their own research. It will be of particular interest to education and psychology assessment specialists who develop and use tests and measures in their work, especially researchers in clinical, educational, personality, social, and health psychology. This book also serves as a supplementary text in graduate courses on educational
