

Earth's Changes Study Guide

Earth is constantly changing. We can see evidence of its changes in the rock cycle, fossils, plate tectonics, and in processes like weathering and erosion.

Earth's Structure:

We tend to think of Earth as just the ground we stand on, but there is much more to our planet. Earth is a complex system made up of air, solid earth, water, and organisms. These parts make up a system that is connected through the flow of matter and energy.

Earth has 4 major layers. Each layer has its own characteristics.

- The **crust** and **mantle** are the 2 outer layers. They are made mostly of rocks and minerals.
- The **outer core** and **inner core** are the 2 inner layers. They are made mostly of iron and nickel (metals). The inner core is very hot.

As you move deeper beneath Earth's surface, the pressure and temperature increase.

Earth's thermal energy (heat energy) causes material to move on and below Earth's surface.

Tectonic Plates:

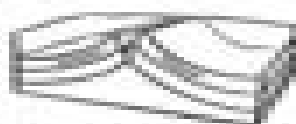

Earth's surface is not just one solid piece. Earth's crust is made of **tectonic plates** – sections of crust the size of continents. They constantly move (very slowly) due to Earth's thermal energy.

A **plate boundary** forms where two plates meet each other. There are 3 different types:

convergent boundaries
occur when plates move
toward each other

divergent boundaries
occur when plates move
away from each other

transform boundaries
occur when plates
slide past each other

As the plates move, they change Earth's surface. They have created tall mountain ranges, like the Appalachian Mountains, and deep ocean trenches. They also create earthquakes and volcanoes along **faults** – cracks in the Earth's crust where the plates have been moving.
