

Below is a problem which is similar to the previous example. Write a complete and thorough solution to the stated follow-up problem. You don't have to format your solution exactly as the example did, however, you must show ample work so as to illustrate your understanding of the problem. Correct answers without proper justification or work will not be given credit.

Photosynthesis: The amount y of photosynthesis that takes place in a certain plant depends on the intensity x of the light (in lumens) present, according to the function $y = 120x^2 - 20x^3$. The model is valid only for non-negative x -values that produce a positive amount of photosynthesis.

- (a) Use your graphing calculator to graph this function on the following viewing window: $[-5, 10]$ by $[-200, 700]$

- (b) Write the above function in factored form. [Hint: Proceed by removing the greatest common factor $20x^2$]

- (c) Use the Zero-Product Property, i.e., use the factors of y to find the values of x that will give 0 photosynthesis.

- (d) What input values make sense for this problem, i.e., what interval of x -values will actually result in a non-negative rate of photosynthesis?

- (e) Graph the function using the input values that make sense for the problem, i.e., graph the function using the interval of x -values found in part (d).
