Handbook for Robustness Validation of Automotive Electrical/Electronic Modules Automotive Electronic Systems Reliability Standards, 2009 This document addresses robustness of electrical electronic modules for use in automotive applications Where practical methods of extrinsic reliability detection and prevention will also be addressed This document primarily deals with electrical electronic modules EEMs but can easily be adapted for use on mechatronics sensors actuators and switches EEM qualification is the main scope of this document Other procedures addressing random failures are specifically addressed in the CPI Component Process Interaction section 10 This document is to be used within the context of the Zero Defect concept for component manufacturing and product use It is recommended that the robustness of semiconductor devices and other components used in the EEM be assured using SAE J1879 OCT2007 Handbook for Robustness Validation of Semiconductor Devices in Automotive Applications The emphasis of this document is on hardware and manufacturing failure mechanisms however other contemporary issues as shown in Figure 1 need to be addressed for a thorough Robustness Validation A Pareto of contemporary issues is shown in Figure 1 Although this document addresses many of the issues shown however some are outside the scope of this document and will need to be addressed for a thorough RV process application Examples of issues outside the scope of this document are system interactions interfaces functionality HMI Human Machine Interface and software At the time of publication of this handbook a system level Robustness Validation handbook which addresses these issues had been initiated In late 2006 Members of the SAE International Automotive

Electronic Systems Reliability Standards Committee and ZVEI German Electrical and Electronic Manufacturers Association formed a joint task force to update SAE Recommended Practice J1211 NOV1978 Recommended Environmental Practices for Electronic Equipment Design. The 1978 version of SAE J1211 was written in an era when electronics were first being introduced to the automobile. There was a high level of concern that the harsh environmental conditions experienced in locations in the vehicle could have a serious negative affect on the reliability of electronic components and systems. Some early engine control modules (ECMs) had failure rates in the 350 failures per million hours (f 106 h) range or expressed in the customer's terms a 25% probability of failure in the first 12 months of vehicle ownership. At that time warranty data was presented in R 100 repairs per 100 vehicles units for example 25 R 100 at 12 months. In these early years when the automotive electronics industry was in its infancy a large percentage of these were hard catastrophic and intermittent failures exacerbated by exposure to environmental extremes of temperature 40 C to 85 C high mechanical loads from rough road vibration and rail shipment mechanical shocks of up to 100 g from handling and crash impact severe electrical transients electrostatic discharge and electromagnetic interference large swings in electrical supply voltage reverse electrical supply voltage and exposure to highly corrosive chemicals e.g. road salt and battery acid. The focus of the 1978 version of SAE J1211 was on characterizing these harsh vehicle environment for areas of the vehicle engine compartment instrument panel passenger compartment truck under body etc and suggesting lab test methods which design engineers could use to evaluate the performance of their components and systems at or near the worst case conditions expected in the area of the vehicle where their electrical electronic components would be mounted. By testing their prototypes at the worst case conditions i.e. at the product's specification limits described in the 1978 version of SAE J1211 designers were able to detect and design out weaknesses and thereby reduce the likelihood of failure due to environmental factors. By the mid 1980s it became common practice to specify test to pass zero failures allowed environmental conditions based reliability demonstration life tests with acceptance levels in the 90% to 95% reliability range with confidence levels of 70% to 90%. This translates to approximately 5 to 20 f 106 h. The sample size for these tests was determined using binomial distribution statistical tables and this would result in a requirement to test 6 to 24 test units without experiencing a failure. If a failure occurred the sample size would have to be increased and the testing continued without another failure till the bogie was reached. The environmental conditions during the test were typically defined such that the units under test were operated at specification limits based on SAE J1211 recommended practices e.g. 40 C and 85 C for at least some portion of the total test time. The goal of passing such a demonstration test was often very challenging and the test analyze fix programs that resulted although very time consuming and expensive produced much needed reliability growth. Reliability improved significantly in the late 1980s and early 1990s and vehicle manufactures and their suppliers began expressing warranty data in R 1000 units instead of R 100 units. By the turn of the century automobile warranty periods had increased from 12 months to 3 4 5 and even 10 years for some systems.

and most manufacturers had started specifying life expectancies for vehicle components of 10 15 and sometimes 20 years And by this time several vehicle manufacturers and their best electrical electronic components suppliers had improved reliability to the point where warranty data was being expressed in parts per million ppm in the triple double and even single digit range This translates to failure rates in the 0.05 f 106 h range and better The achievement of such high reliability is not the result of test to pass reliability demonstration testing based on binomial distribution statistical tables With this method reliability demonstration in the 99.99% to 99.9999% range would require thousands of test units On the contrary the methods and techniques used by engineering teams achieving such reliability excellence did not require increasingly large sample sizes more expensive and lengthy testing or more engineers It is about working smarter not harder and about systems level robust design and robustness validation thinking rather than component level test to pass thinking The task force leaders and members were of the strong opinion that the 2008 version of SAE J1211 should document the state of the art methods and techniques being used by leading companies and engineering teams to achieve ultra high reliability while at the same time reducing overall cost life cycle and shortening time to market The SAE International Automotive Electronic Systems Reliability Standards Committee and ZVEI German Electrical and Electronic Manufacturers Association are hopeful that this Handbook for Robustness Validation of Automotive Electrical Electronic Modules will help many companies and engineering teams make the transition from the 1980s cookbook reliability demonstration approach to a more effective economically feasible knowledge based Robustness Validation approach

*Reliability Prediction for Automotive Electronics Based on Field Return Data* Automotive Electronic Systems Reliability Standards, 2017 This document should be used as guidance for non handbook based reliability predictions conducted on automotive electronics products It presents a method that utilizes warranty and field repair data to calculate the failure rates of individual electronic components and predict the reliability of the entire electronic system It assumes that the user has access to a database containing field return data with classification of components times to failure and a total number of components operating in the field In early design activities typically before the hardware is built a reliability prediction is often required for the electronic components and systems in order to assess their future reliability and in many cases to meet customer specifications Those specifications may include the allocated reliability for a particular electronic unit and in the cases of functional safety products to meet the ASIL Automotive Safety and Integrity Level requirement specified by the international functional safety standard ISO 26262 This Recommended Practice RP document will provide guidance on performing reliability predictions for automotive electronic products utilizing field return data or any other types of failure data available to an automotive electronics supplier This document will cover the possible sources of data types of the data required ways to collect it and the methodology of how to process these data to calculate the failure rates and the expected reliability This document will also include a case study based on the data obtained by Delphi Electronics Safety a Tier 1 automotive supplier to illustrate the process of reliability

prediction based on field return data
