

Dung beetles their eggs and larvae among flies and maggots provide a hearty feast for opportunistic ornate box turtle living amid cattle.

Natural History: Western box turtles are typically more limited in their activity than their eastern relatives. This is due primarily to the drier climate they inhabit which effectively restricts the available number of suitable refuge sites. Because of these factors western box turtles spend a significant amount of their time seeking refuge from adverse or extreme climatic patterns in previously excavated mammal burrows. The burrows excavated by kangaroo rats (*Dipodomys* sp.) and other mammals are vital to the survival of the western box turtle. This is because the ground is often too hard to for the turtles to dig into (Plummer, 2004). However, in some portions of their range western box turtles have been found in and under cow paddies.

Even female western box turtles tend to display more uniform carapace patterns as they advance in age.
