

LIFE CYCLE OF PLANTS

Life Cycle of Plants

Once upon a time, there was a tiny seed. This seed was very special because it had everything it needed to grow into a big and beautiful plant. But first, it had to go through a process called the "life cycle of plants."

The first stage of the life cycle is the seed stage. In this stage, the seed is just a small and hard little thing. It might look like it's not doing anything, but it actually has all the necessary parts inside to start growing into a plant.

Next, the seed sprouts and grows into a seedling. This is the stage where the seed starts to turn into a small plant with leaves, stem and roots. The leaves help the plant make its own food by using sunlight, water and carbon dioxide through a process called photosynthesis. The roots absorb water and nutrients from the soil. The stem supports the plant and helps it grow taller.

As the plant continues to grow, it enters the vegetative stage. This is when the plant starts to produce flowers and fruits. The flowers are the plant's reproductive organs. They contain the plant's seeds, which can be used to grow new plants. The fruits are the protective covering of the seeds, which can be eaten by animals or humans.

The final stage of the life cycle is the reproductive stage. In this stage, the flowers are pollinated by bees, butterflies, or wind, and the fruits and seeds begin to form. Once the seeds are mature, they fall off the plant and begin the life cycle all over again by sprouting and growing into new plants.

As you can see, the life cycle of plants is an amazing process that helps new plants grow and thrive. Without the life cycle, we wouldn't have the beautiful flowers, delicious fruits and the fresh air we enjoy.
