Computer Aided Modeling Analysis Vtu Lab Manual:

Kas yra kas Lietuvoje ,1997 *Who is who in Lithuania* ,2006 **Computer-aided Model Generation and Validation for Dynamic Systems** Brian P. Brisbine,1998 The primary goal of any model is to emulate as closely as possible the desired behavioral phenomena of the real system but still maintain some tangible qualities between the parameters of the model and the system response In keeping with this directive models by their very nature migrate towards increasing complexity and hence quickly become tedious to construct and evaluate In addition it is sometimes necessary to employ several different analysis techniques on a particular system which often requires modification of the model As a result the concept of versatile step wise automated model generation was realized as a means of transferring some of the laborious tasks of model derivation from the analyst to a suitable program algorithm The focus of this research is on the construction and verification of an efficient modeling environment that captures the dynamic properties of the system and allows many different analysis techniques to be conveniently implemented This is accomplished through the implementation of Mathematica by Wolfram Research Inc The presented methodology utilizes rigid body lumped parameter systems and Lagrange s energy formalism The modeling environment facilitates versatility by allowing straightforward transformations of the model being developed to different forms and domains The final results are symbolic expressions derived from the equations of motion However this approach is predicated upon the absence of significant low frequency flexible vibration modes in the system This requirement can be well satisfied in the parallel structure machine tools the main subject of this research The modeling environment allows a number of techniques for validation to be readily implemented This includes intuitive checks at key points during model derivation as well as applications of more traditional experimental validation In all presented cases the analysis can be performed in the same software package that was used for model development Integration of the generation validation and troubleshooting methodology delineated in this research facilitates development of accurate models that can be applied in structure design and exploitation Possible applications of these models include parameter identification visualization of vibration automated supervision and monitoring and design of advanced control strategies for minimization of dynamic tool path errors The benefits are especially prevalent in parallel structure machine tools where there is still a lack of experience Latest developments in measurement techniques and the emergence of new sensors facilitate reliable validation and optimization of the models **Model Building Techniques for Analysis** ,2009 The practice of mechanical engineering for product development has evolved into a complex activity that requires a team of specialists for success Sandia National Laboratories SNL has product engineers mechanical designers design engineers manufacturing engineers mechanical analysts and experimentalists qualification engineers and others that contribute through product realization teams to develop new mechanical hardware The goal of SNL s Design Group is to change product development by enabling design teams to collaborate within a virtual model based environment whereby analysis is used to

guide design decisions Computer aided design CAD models using PTC s Pro ENGINEER software tools are heavily relied upon in the product definition stage of parts and assemblies at SNL The three dimensional CAD solid model acts as the design solid model that is filled with all of the detailed design definition needed to manufacture the parts Analysis is an important part of the product development process The CAD design solid model DSM is the foundation for the creation of the analysis solid model ASM Creating an ASM from the DSM currently is a time consuming effort the turnaround time for results of a design needs to be decreased to have an impact on the overall product development This effort can be decreased immensely through simple Pro ENGINEER modeling techniques that summarize to the method features are created in a part model This document contains recommended modeling techniques that increase the efficiency of the creation of the ASM from the DSM
