An Introduction to the Theory of Formal Languages and Automata Willem J. M. Levelt,2008 The present text is a re edition of Volume I of Formal Grammars in Linguistics and Psycholinguistics a three volume work published in 1974 This volume is an entirely self contained introduction to the theory of formal grammars and automata which hasn't lost any of its relevance Of course major new developments have seen the light since this introduction was first published but it still provides the indispensable basic notions from which later work proceeded The author's reasons for writing this text are still relevant an introduction that does not suppose an acquaintance with sophisticated mathematical theories and methods that is intended specifically for linguists and psycholinguists thus including such topics as learnability and probabilistic grammars and that provides students of language with a reference text for the basic notions in the theory of formal grammars and automata as they keep being referred to in linguistic and psycholinguistic publications the subject index of this introduction can be used to find definitions of a wide range of technical terms An appendix has been added with further references to some of the core new developments since this book originally appeared Automata Theory and Formal Languages Alberto Pettorossi,2013

A Course in Formal Languages, Automata and Groups Ian M. Chiswell, 2009-02-06 This book is based on notes for a master s course given at Queen Mary University of London in the 1998-9 session Such courses in London are quite short and the course consisted essentially of the

material in the first three chapters together with a two hour lecture on connections with group theory Chapter 5 is a considerably expanded version of this For the course the main sources were the books by Hopcroft and Ullman [20] by Cohen [4] and by Epstein et al [7] Some use was also made of a later book by Hopcroft and Ullman [21] The ulterior motive in the first three chapters is to give a rigorous proof that various notions of recursively enumerable language are equivalent Three such notions are considered These are generated by a type 0 grammar recognised by a Turing machine deterministic or not and defined by means of a Godel numbering having defined recursively enumerable for sets of natural numbers It is hoped that this has been achieved without too many arguments using complicated notation This is a problem with the entire subject and it is important to understand the idea of the proof which is often quite simple Two particular places that are heavy going are the proof at the end of Chapter 1 that a language recognised by a Turing machine is type 0 and the proof in Chapter 2 that a Turing machine computable function is partial recursive
