Biomedical Applications of Microencapsulation Franklin Lim, 2019-06-12 Published in 1984 For this volume the publishers at CRC Press have chosen to present information on just one important area namely the biomedical field where much progress in the application of microencapsulation has been made in recent years *Journal of the Association of Official Analytical Chemists*, 1975

Adamovics, 1990 *Cumulated Index Medicus*, 1966 **New Trends in Allergy II** Johannes Ring, Günter Burg, 2012-12-06

Anergic reactions and anergic diseases are found in many fields of medicine As wen as affecting the skin allergic diseases occur in internal organs such as the lungs and the kidneys and in the vascular and nervous systems Interdisciplinary understanding and cooperation thus seem necessary to get a better insight into allergic reactions in the different fields of medicine in order that we may give our patients the best diagnostic and therapeutic care Allergic diseases are on the increase Studies from Sweden show that 15% of the population there are atopic and some people speculate that in Germany about 10% 15% of all adults suffer from one of the many different allergic conditions We in our clinic also have the impression that the incidence of atopic reactions has increased in recent years The figure of 15% would mean something like 200 000 people in Munich alone We all know that a wide variety of environmental factors can induce allergic reactions in the skin the respiratory system or internal organs The most important anergens in our environment are pollen molds animal dander housedust mite food or food additives various insects industrial compounds and drugs The direct costs of hospital and community medical care other services and drugs to help patients with asthma hay fever and skin allergies have in creased considerably in the last 10 years The figures should make it clear to everybody that we are dealing with a health and environmental problem of great practical importance

Dissolving/Disintegrating Dosage Forms Vikas Anand Saharan, 2017-05-11 Fast Dissolving Disintegrating Dosage Forms

FDDFs have been commercially available since the late 1990s FDDFs were initially available as orodispersible tablets and later as orodispersible films for treating specific populations pediatrics geriatrics and psychiatric patients Granules pellets and mini tablets are among latest additions to these dosage forms which are still in the development pipeline As drug delivery systems FDDFs enable quicker onset of action immediate drug delivery and sometimes offer bioavailability benefits

due to buccal sublingual absorption With time FDDF have evolved to deliver drugs in a sustained and controlled manner Their current market and application is increasing in demands with advances in age adapted dosage forms for different patients and changing regulatory requirements that warrant mandatory assessments of new drugs and drug products before commercial availability This book presents detailed information about FDDFs from their inception to recent developments Readers will learn about the technical details of various FDDF manufacturing methods formulation aspects evaluation and methods to conduct clinical studies The authors also give examples of marketed fast disintegrating dissolving drug products in US Europe Japan and India This reference is ideal for pharmacology students at all levels seeking information about this specific form of drug delivery and formulation

Formulation and Evaluation of Mouth Dissolving Tablets Reshu Gupta,2013 Oral delivery is currently the gold standard in the pharmaceutical industry where it is regarded as the safest most convenient and most economical method of drug delivery having the highest patient compliance This tablet format is designed to allow administration of an oral solid dose form in the absence of water or fluid intake Such tablets readily dissolve or disintegrate in the saliva generally within

Formulation and Evaluation Mouth Dissolving Tablets of Tramadol HCL Raja Sridhar Rao Ponugoti,Chandrashekara Rao Gonugunta,2015-08-11 According to United States Pharmacopoeia the orodispersible tablets may be defined as solid dosage form containing medicinal substance or active ingredient which disintegrates rapidly within a matter of seconds when placed upon the tongue This means that the tablets dissolve or disintegrate in the oral cavity without use of water In this regard the tablets need to improve disintegration time dispersion time drug release studies bioavailability and patient compliance and also need to mask the bitter taste of the drug and to maintain the drug stable at accelerated condition i e 40 C 75% RH up to 6 months period as per ICH guidelines Tramadol HCl is centrally acting synthetic opioid analgesic for the treatment of moderate to severe pain and is readily soluble in water The half life of the drug is around 5.5 hours The MDT s place a major role for rapid onset of action for geriatrics pediatrics and the patients who have less access of water The drug itself having bitter taste so the present authors developed mouth dissolving tablets of tramadol HCl with the aim to mask the bitter taste of the drug to minimize the disintegration time and improve the drug release rate

Disintegrating Agents in Selected Formulations William Feinstein, 1965 *Poorly Soluble Drugs* Gregory K. Webster, Robert G. Bell, J. Derek Jackson, 2017-01-06 This book is the first text to provide a comprehensive assessment of the application of fundamental principles of dissolution and drug release testing to poorly soluble compounds and formulations. Such drug products are vis vis their physical and chemical properties inherently incompatible with aqueous dissolution. However, dissolution methods are required for product development and selection as well as for the fulfillment of regulatory obligations with respect to biopharmaceutical assessment and product quality understanding. The percentage of poorly soluble drugs defined in classes 2 and 4 of the Biopharmaceutics Classification System (BCS) has significantly increased in the modern pharmaceutical development pipeline. This book provides a thorough exposition of general method development strategies for such drugs including instrumentation and media selection, the use of compendial and non compendial techniques in product development and phase appropriate approaches to dissolution development. Emerging topics in the field of dissolution are also discussed including biorelevant and biphasic dissolution, the use of enzymes in dissolution testing, dissolution of suspensions and drug release of non oral products. Of particular interest to the industrial pharmaceutical professional, a brief overview of the formulation and solubilization techniques employed in the development of BCS class 2 and 4 drugs to overcome solubility challenges is provided and is complemented by a collection of chapters that survey the approaches and considerations in developing dissolution methodologies for enabling drug delivery technologies including nanosuspensions, lipid based formulations and stabilized amorphous drug formulations.

Fast Dissolving Tablet Of An Anti-inflammatory Drug Kalpen Patel, Maulika Patel, Garvit Patel, 2012 **The Formulation and Evaluation of Orally Disintegrating Tablets** Stephanie M. Chillias, 2013 Orally disintegrating tablets are a vital tool in keeping our children and elderly population healthy. Their ease of use and accurate dosing allow higher patient compliance and more reliable therapeutic effects. Superdisintegrants are the fundamental element contained in orally disintegrating tablets and are responsible for their unique ability to quickly disintegrate and dissolve on the surface of the tongue without the use of any additional liquid. In order to determine the most effective type and optimal amount of superdisintegrants for orally disintegrating tablets manufactured by direct compression, the following tablet parameters were tested based on the standard USP 30 methods: hardness, thickness, friability, disintegration time and wetting time. Four superdisintegrants were tested: namely Kollidon CL, SF, Primojel, Ac Di Sol and Polyplasdone XL and the most efficient superdisintegrant was selected based on the above mentioned studies. Polyplasdone XL outperformed the other superdisintegrants in nearly all the concentrations and all of the testing parameters. The ideal concentration was 5% Polyplasdone XL for the orally disintegrating tablets before the API, diphenhydramine HCl, was added. Various concentrations were analyzed using the aforementioned parameters and 10% Polyplasdone XL was selected for the final formulation. Tablets were tested over eight weeks of accelerated stability testing at various temperatures to determine percent of diphenhydramine HCl released in

dissolution disintegration time wetting time hardness thickness and weight variation The tablets remained stable and within the acceptable range of drug release 90% 110% at the three temperatures analyzed Additionally tablets were analyzed at different levels of relative humidity for percent weight change and change in hardness The final formulation of diphenhydramine HCl tablets was stable between 3 40 C and at 33% relative humidity or less for eight weeks
