

CT PHYSICS

Mahadevappa Mahesh, MS, PhD

1. What is CT?

CT is a method for acquiring and reconstructing an image of a thin cross section of an object. It is based on measurements of x-ray attenuation through the section using many different projections. This is achieved by rotating both x-ray tube and detectors around the patient.

2. How is CT different from conventional radiographs?

CT differs from conventional radiography in two significant ways:

- CT forms a cross-sectional image, eliminating the superimposition of structures that occurs in plain film imaging because of compression of three-dimensional (3D) body structures onto the two-dimensional recording system.
- The sensitivity of CT to subtle differences in x-ray attenuation is at least a factor of 10 higher than normally achieved by film screen recording systems because of the virtual elimination of scatter.

3. What are the basic principles of CT?

Fundamentally a CT scanner makes many measurements of attenuation through the plane of a finite thickness cross section of the body. The system uses these data to reconstruct a digital image of the cross section in which each pixel in the image represents a measurement of the mean attenuation of a box-like element (voxel) extending through the thickness of the section. An attenuation measurement quantifies the fraction of radiation removed in passing through a given amount of a specific material of thickness Δx , as shown in Fig. 1-1. Attenuation is expressed as:

$$I_1 = I_0 e^{-\mu \Delta x}$$

where, I_1 and I_0 are the x-ray intensities measured with and without the material in the x-ray beam path, respectively, and μ is the linear attenuation coefficient of the specific material (see Fig. 1-1). The image reconstruction process, such as the filtered back-projection method and many other methods, are applied to derive the average attenuation coefficient (μ) values for each voxel in the cross section, using many rays from many different rotational angles around the cross section.

4. How is CT signal produced?

A CT signal results from tissue discrimination based on the variations in attenuation between "voxels," which depends on differences in voxel density and atomic number of elements present and is influenced by the detected mean photon energy.

5. What is a CT image?

A CT image as shown later is composed of pixels (picture elements). Each pixel on the image represents the average x-ray attenuation in a small volume (voxel) that extends through the tissue section. In Fig. 1-2, the pixel size is exaggerated. In addition, in a real CT image, all tissues within a single pixel would be the same shade of gray.
