**Development of a Traffic Signal Performance Measurement System (TSPMS)** Kevin N. Balke, Hassan A. Charara, Ricky Parker, 2005 The purpose of this research was to examine the type of performance measures that could be collected at an intersection and develop a system for automatically collecting these performance measures in the field We began the research by conducting an assessment of the needs of the Texas Department of Transportation TxDOT practitioners for an automated system to collect intersection and traffic signal performance measures We then examined capabilities of some of the existing traffic signal controllers and detection systems to produce the desired performance measures Based on the findings of the needs assessments and an evaluation of the limitation of the existing detection system we developed a series of innovative performance measures that practitioners could use to assess traffic operations and the effectiveness of the signal timing at intersections We then developed a prototype system for automatically collecting these data in the field We installed the prototype system in two different locations that exhibited different operating characteristics and assessed the ability of the system to collect meaningful and appropriate performance measures

**Adaptive Left Turn Phasing** Allison C. Meadors, 1997 As technology in the traffic controller industry continues to improve controllers are now more responsive to changing traffic conditions Taking advantage of the advances in traffic controller technology the Texas Transportation Institute designed an adaptive left turn feature for a signal controller Automatic Signal Eagle Signal has introduced this logic internal to their EPAC 300 controller which is capable of deciding and implementing when a separate left turn phase should be provided or when permissive operation is acceptable based on traffic conditions The adaptive left turn feature was tested for a wide range of left turn volumes and opposing through volumes Measures of effectiveness that were examined included cycle length average stopped delay total delay and queue length It was determined that the adaptive feature activated in the controller typically provided a benefit to the opposing through traffic some disadvantage to the left turning traffic but generally a benefit to the overall intersection
