Issues on Risk Analysis for Critical Infrastructure Protection Vittorio Rosato, Antonio Di Pietro, 2021-07-07 Critical infrastructure provides essential services to citizens The mutual dependencies of services between systems form a complex system of systems with a large perturbation surface prone to be damaged by natural and anthropic events Their intrinsic and extrinsic vulnerabilities could be overcome by providing them adaptive properties to allow fast and effective recovery from loss of functionality Resilience is thus the key issue and its enhancement at the systemic level is a priority goal to be achieved This volume reviews recent insights into the different domains resilience enhancing strategies impact and threats knowledge and dependency related issues and proposes new strategies for better critical infrastructure protection

risk and the mitigation of hazards is of fundamental importance to planners and researchers around the world We live in an increasingly complex society with the potential for disasters on a worldwide scale Natural hazards such as floods earthquakes landslides fires and others have always affected human societies Man made hazards however played a comparatively small role a few centuries ago until the risk of catastrophic events started to increase due to the rapid growth of new technologies The interaction of natural and anthropogenic risks adds to the complexity of the problem Topics covered include Risk assessment Risk management Hazard prevention management and control Early warning systems Risk mapping Natural hazards Disaster management Vulnerability assessment Health risk Debris flow and flood hazards Case studies Climate change Safety and security Evacuation simulation and design Political and economic vulnerability **Critical Infrastructure** Antonio Di Pietro, José Martí, 2024-02-14 Modern critical infrastructures CIs e g electricity water transportation telecommunications and others form complex systems with a high degree of interdependencies from one CI to the others Natural disasters e g earthquakes floods droughts landslides and wildfires humanmade disasters e g sabotage and terrorism and system faults due to structural and equipment failures will affect not only the directly impacted CI but all interdependent CIs Risk assessment therefore has to be done over the entire system of CIs and should also include the social and personal impacts According to a 2022 report 80% of cities have been affected by significant climate change hazards represented by extreme heat 46% heavy rainfall 36% drought 35% and floods 33% The impacts of climate change therefore affect the complex system of the built environment and result in interrelated consequences at different scales ranging from single buildings to urban spaces and territorial infrastructures Since it is not possible to reduce the severity of natural hazards the main opportunity for lowering risk lies in reducing vulnerability and exposure Vulnerability and exposure are related to urban development choices and practices that weaken the system s robustness This volume reviews recent insights from risk identification and reduction to preparedness and financial protection strategies and proposes new approaches for better CIs and built environment protection *Group Decision and Negotiation 2014 GDN 2014* P.
