

Food security and environmental conservation are two of the greatest challenges facing the world today. It is predicted that food production must increase by at least 70% before 2050 to support continued population growth, although the size of the world's agricultural area will remain essentially unchanged.

This updated and thoroughly revised second edition provides in-depth coverage of the impact of environmental conditions and management on crops, resource requirements for productivity, and effects on soil resources. The approach is explanatory and integrative, with a firm basis in environmental physics, soils, physiology, and morphology. System concepts are explored in detail throughout the book, giving emphasis to quantitative approaches, management strategies and tactics employed by farmers, and associated environmental issues.

Drawing on key examples and highlighting the role of science, technology, and economic conditions in determining management strategies, this book is suitable for agriculturalists, ecologists, and environmental scientists.

"Any practitioner or student of 'evidence-based agriculture' needs a copy of this book." *W. Paul Doolittle, University of Minnesota*

"... a timely update of a foundational text for college or graduate curricula... This book is remarkably easy to read and will be accessible to a range of knowledge levels and backgrounds." *Stefan M. Bräuer, Purdue University*
