Discrete Mathematics Using a Computer Cordelia Hall, John O'Donnell, 2013-04-17 Several areas of mathematics find application throughout computer science and all students of computer science need a practical working understanding of them These core subjects are centred on logic sets recursion induction relations and functions The material is often called discrete mathematics to distinguish it from the traditional topics of continuous mathematics such as integration and differential equations The central theme of this book is the connection between computing and discrete mathematics This connection is useful in both directions Mathematics is used in many branches of computer science in applications including program specification datastructures design and analysis of algorithms database systems hardware design reasoning about the correctness of implementations and much more Computers can help to make the mathematics easier to learn and use by making mathematical terms executable making abstract concepts more concrete and through the use of software tools such as proof checkers These connections are emphasised throughout the book Software tools see Appendix A enable the computer to serve as a calculator but instead of just doing arithmetic and trigonometric functions it will be used to calculate with sets relations functions predicates and inferences There are also special software tools for example a proof checker for logical proofs using natural deduction

Matlab Simulink as well as the development of an intelligent control approach that includes smart microgrid distribution and optimization. The book includes aspects in the simulation and optimization of stand alone hybrid renewable energy systems and co generation in isolated or islanded microgrids. It focusses on the stepwise development of a hybrid solar driven micro combined cooling heating and power mCCHP compact trigeneration polygeneration and thermal energy storage TES system with intelligent weather prediction weak ahead scheduling time horizon and look ahead dispatch on integrated smart microgrid distribution principles. The solar harvesting and solar thermodynamic system includes an automatic sun tracking platform based on a PLC controlled mechatronic sun tracking system that follows the sun progressing across the sky. An intelligent energy management and adaptive learning control optimization approach is proposed for autonomous off grid remote power applications both for thermodynamic optimization and smart micro grid optimization for distributed energy resources DER. The correct resolution of this load following multi objective optimization problem is a complex task because of the high number and multi dimensional variables, the cross correlation and interdependency between the energy streams as well as the non linearity in the performance of some of the system components. Exergy based control approaches for smartgrid topologies are considered in terms of the intelligence behind the safe and reliable operation of a microgrid in an automated system that can manage energy flow in electrical as well as thermal energy systems. The standalone micro grid solution would be suitable for a rural village intelligent building district energy system campus power shopping mall centre isolated network eco estate or remote island application setting where self generation and decentralized energy system concepts play a role. Discrete digital simulation models for the thermodynamic and active demand side management systems with digital smartgrid control unit to optimize the system energy management is currently under development. Parametric simulation models for this trigeneration system polygeneration poligeneration quadgeneration are developed on the Matlab Simulink and TrnSys platforms. In terms of model predictive coding strategies the automation controller will perform multi objective cost optimization for energy management on a microgrid level by managing the generation and storage of electrical heat and cooling energies in layers. Each layer has its own set of smart microgrid priorities associated with user demand side cycle predictions. Mixed Integer Linear Programming and Neural network algorithms are being modeled to perform Multi Objective Control optimization as potential optimization and adaptive learning techniques.
