

Structure of the Sun

The convection zone is further from the center of the Sun than the radioactive zone. At this point turbulent convection movements occur. The spinning motions within the Sun are responsible for the grainy pattern seen on the Sun's surface.

Inside the Sun, the radiation zone is located in the intermediate zone between the solar nucleus, at a distance of 0.2 solar radius measured from the center of the Sun, to the convective zone, at a distance of 0.71 radius.

- The core of the Sun is
- 1) at the same temperature and density as the surface;
 - 2) at the same temperature but denser than the surface;
 - 3) hotter and denser than the surface;
 - 4) constantly rising to the surface through convection.
 - 5) composed of iron.

The solar corona is the outermost layer of the Sun, it is composed of plasma and extends over the chromosphere. It can be observed from the Earth.

It is the luminous surface of the Sun and it is gaseous. The photosphere is the boundary between the thinnest and most transparent matter on the outside of the Sun and the dense, gaseous mass of its central regions.

They are dark spots that appear on the surface of the Sun. They usually last several days.

The chromosphere is located around the photosphere, composed mainly of hydrogen gas.

Coronal holes are regions of lower density and temperature than the Sun's outer atmosphere, known as the corona.
