Discrete Choice Modelling And Air Travel Demand:

Discrete Choice Modelling and Air Travel Demand Professor Laurie A Garrow, 2012-10-01 In recent years airline practitioners and academics have started to explore new ways to model airline passenger demand using discrete choice methods This book provides an introduction to discrete choice models and uses extensive examples to illustrate how these models have been used in the airline industry These examples span network planning revenue management and pricing applications Numerous examples of fundamental logit modeling concepts are covered in the text including probability calculations value of time calculations elasticity calculations nested and non nested likelihood ratio tests etc The core chapters of the book are written at a level appropriate for airline practitioners and graduate students with operations research or travel demand modeling backgrounds Given the majority of discrete choice modeling advancements in transportation evolved from urban travel demand studies the introduction first orients readers from different backgrounds by highlighting major distinctions between aviation and urban travel demand studies This is followed by an in depth treatment of two of the most common discrete choice models namely the multinomial and nested logit models More advanced discrete choice models are covered including mixed logit models and generalized extreme value models that belong to the generalized nested logit class and or the network generalized extreme value class An emphasis is placed on highlighting open research questions associated with these models that will be of particular interest to operations research students Practical modeling issues related to data and estimation software are also addressed and an extensive modeling exercise focused on the interpretation and application of statistical tests used to guide the selection of a preferred model specification is included the modeling exercise uses itinerary choice data from a major airline The text concludes with a discussion of on going customer modeling research in aviation Discrete Choice Modelling and Air Travel Demand is enriched by a comprehensive set of technical appendices that will be of particular interest to advanced students of discrete choice modeling theory The appendices also include detailed proofs of the multinomial and nested logit models and derivations of measures used to represent competition among alternatives namely correlation direct elasticities and cross elasticities

Discrete Choice Modelling and Air Travel Demand Laurie A. Garrow, 2010 The core chapters of the book are written at a level appropriate for airline practitioners and graduate students with operations research or travel demand modeling backgrounds Given the majority of discrete choice modeling advancements in transportation evolved from urban travel demand studies the introduction first orients readers from different backgrounds by highlighting major distinctions between aviation and urban travel demand studies This is followed by an in depth treatment of two of the most common discrete choice models namely the multinomial and nested logit models More advanced discrete choice models are covered including mixed logit models and generalized extreme value models that belong to the generalized nested logit class and or the network generalized extreme value class An emphasis is placed on highlighting open research questions associated with these models that will be of

particular interest to operations research students Practical modeling issues related to data and estimation software are also addressed and an extensive modeling exercise focused on the interpretation and application of statistical tests used to guide the selection of a preferred model specification is included the modeling exercise uses itinerary choice data from a major airline The text concludes with a discussion of on going customer modeling research in aviation

Discrete-Choice Modelling David A. Hensher,Lester W. Johnson,2018-04-09 Originally published in 1981 Discrete choice modelling is an area of econometrics where significant advances have been made at the research level This book presents an overview of these advances explaining the theory underlying the model and explores its various applications It shows how operational choice models can be used and how they are particularly useful for a better understanding of consumer demand theory It discusses particular problems connected with the model and its use and reports on the authors own empirical

of the twenty seven papers included in the book deal with timeless and fundamental subjects in transport economics and have been evaluated by many instructors as being effective papers for teaching The book is organised into six parts Transport Demand Transport Cost Pricing Infrastructure Regulation and Market Structure and Project Evaluation Airport Competition Peter Forsyth,David Gillen,Jurgen Muller,Hans-Martin Niemeier,2016-03-23 The break up of BAA and the blocked takeover of Bratislava airport by the competing Vienna airport have brought the issue of airport competition to the top of the agenda for air transport policy in Europe Airport Competition reviews the current state of the debate and asks whether airport competition is strong enough to effectively limit market power It provides evidence on how travellers chose an airport thereby altering its competitive position and on how airports compete in different regions and markets The book also discusses the main policy implications of mergers and subsidies *ITF Round Tables Competitive Interaction between Airports, Airlines and High-Speed Rail* International Transport Forum,2009-11-04 This round table proceedings examines whether and how airports should be regulated to contain market power It determines which approaches are likely to work best and also assesses strategies for managing greenhouse gas emissions including the alternative of high speed rail

Regional Airports M. N. Postorino,2011 Regional Airports have become increasingly important elements of the air network system both as feeders of hub and spoke services and as origins or destination of point to point services Congestion at the main hubs and increasing demand for air transportation both for passengers and freight services necessitates revaluation of the overall air systems with regional airports taking an ever expanding role Optimisation of air transportation systems within the framework of other forms of transport plays an important part in the present quest for sustainability Congestion nowadays is not only associated with countries such as the USA and those in the EU but also a variety of other countries with fast developing economies where there is a strong increase in air transportation demand The revolution of the existing airport system including regional airports requires the developing of new optimisation tools which can simulate the whole process and produce optimal solutions These models are also essential to predict future demands and in particular the role that regional airports will play The siting of new airports involves taking into consideration a variety of environmental ecological social and economic factors which transcend the problem of transportation resources optimisation itself Regional Airports can be a powerful driving force behind the development of an area and conversely can result in major problems if they are wrongly sited
