

# How does the machine deliver air to the patient?

- The machine is an electronic control circuit with a coil that is attached to a rubber bellow/diaphragm to create a piston. When this piston moves forward, air goes into the patient, creating the inspiratory phase. When the piston is driven away from the patient, it creates active expiration.

- The air that goes into the patient is supplied by the bias flow, and the air that goes out through the gas flow.
