Here the focus is on domains with small holes and the perturbation parameter is the size of the holes. The book is the first introduction to the topic and covers the theoretical material and its applications to a series of problems that range from simple illustrative examples to more involved research results The Functional Analytic Approach makes constant use of the integral representation method for the solutions of boundary value problems of Potential Theory of the Theory of Analytic Functions both in finite and infinite dimension and of Nonlinear Functional Analysis Designed to serve various purposes and readerships the extensive introductory part spanning Chapters 1 7 can be used as a reference textbook for graduate courses on classical Potential Theory and its applications to boundary value problems The early chapters also contain results that are rarely presented in the literature and may also therefore attract the interest of more expert readers. The exposition moves on to introduce the Functional Analytic Approach A reader looking for a quick introduction to the method can find simple illustrative examples specifically designed for this purpose More expert readers will find a comprehensive presentation of the Functional Analytic Approach which allows a comparison between the approach of the book and the more classical expansion methods of Asymptotic Analysis and offers insights on the specific features of the approach and its applications to linear and nonlinear boundary value problems Numerical Analysis of Multiscale Problems Ivan G. Graham, Thomas Y. Hou, Omar Lakkis, Robert Scheichl, 2012-01-05 The 91st London Mathematical Society Durham Symposium took place from July 5th to 15th 2010 with more than 100 international participants attending The Symposium focused on Numerical Analysis of Multiscale Problems and this book contains 10 invited articles from some of the meeting s key speakers covering a range of topics of contemporary interest in this area Articles cover the analysis of forward and inverse PDE problems in heterogeneous media high frequency wave propagation atomistic continuum modeling and high dimensional problems arising in modeling uncertainty Novel upscaling and preconditioning techniques as well as applications to turbulent multi phase flow and to problems of current interest in materials science are all addressed As such this book presents the current state of the art in the numerical analysis of multiscale problems and will be of interest to both practitioners and

The topics covered by this volume include in particular domain perturbations for boundary value problems singular solutions of semilinear elliptic problems positive solutions to elliptic equations on unbounded domains symmetry of solutions stationary compressible Navier Stokes equation Lotka Volterra systems with cross diffusion and fixed point theory for elliptic boundary value problems Collection of self contained state of the art surveys Written by well known experts in the field Informs and updates on all the latest developments Existence and Regularity Results for Some Shape Optimization Problems Bozhidar Velichkov, 2015-03-21 We study the existence and regularity of optimal domains for functionals depending on the spectrum of the Dirichlet Laplacian or of more general Schr dinger operators. Anisotropic Isoperimetric Problems and Related Topics Valentina Franceschi, Alessandra Pluda, Giorgio Saracco, 2024-12-18 This book contains contributions from speakers at the Anisotropic Isoperimetric Problems hence it also appears in describing systems of particles where a balance between attractive and repulsive forces appears A prominent example is that of Gamow's liquid drop model for atomic nuclei where protons are subject to the strong nuclear attractive force represented by the perimeter and the electromagnetic repulsive force represented by a nonlocal term Such a model has been shown to be sound as it explains the basic characteristics of the nuclei and it successfully predicts nuclear fission for nuclei with a large atomic number Similar energy functionals model various physical and biological systems showcasing the competition between short range interfacial and long range nonlocal terms leading to pattern formation The authors mention e g the Ohta Kawasaki model for microphase separation of diblock copolymers and the Yukawa potential for colloidal systems Despite diverse systems the emergence of microphases follows similar patterns although rigorously proving this phenomenon remains a challenge The book collects several contributions within these topics shedding light on the current state of the art
