Combinatorial Algorithms Enlarged Second Edition M T Shing:

Combinatorial Algorithms T. C. Hu, M. T. Shing, 2012-04-26 This updated edition presents algorithms for shortest paths maximum flows dynamic programming and backtracking Also discusses binary trees heuristic and near optimums matrix multiplication and NP complete problems Includes 153 black and white illustrations and 23 tables

Numerical Analysis Walter Gautschi, 2011-12-06 Revised and updated this second edition of Walter Gautschi's successful *Numerical Analysis* explores computational methods for problems arising in the areas of classical analysis approximation theory and ordinary differential equations among others Topics included in the book are presented with a view toward stressing basic principles and maintaining simplicity and teachability as far as possible while subjects requiring a higher level of technicality are referenced in detailed bibliographic notes at the end of each chapter Readers are thus given the guidance and opportunity to pursue advanced modern topics in more depth Along with updated references new biographical notes and enhanced notational clarity this second edition includes the expansion of an already large collection of exercises and assignments both the kind that deal with theoretical and practical aspects of the subject and those requiring machine computation and the use of mathematical software Perhaps most notably the edition also comes with a complete solutions manual carefully developed and polished by the author which will serve as an exceptionally valuable resource for instructors

Research Trends in Combinatorial Optimization William J. Cook, László Lovász, Jens Vygen, 2008-11-07 The editors and authors dedicate this book to Bernhard Korte on the occasion of his seventieth birthday We the editors are happy about the overwhelming feedback to our initiative to honor him with this book and with a workshop in Bonn on November 3-7 2008 Although this would be a reason to look back we would rather like to look forward and see what are the interesting research directions today This book is written by leading experts in combinatorial optimization All papers were carefully reviewed and eventually twenty three of the invited papers were accepted for this book The breadth of topics is typical for the field combinatorial optimization builds bridges between areas like combinatorics and graph theory submodular functions and matroids network flows and connectivity approximation algorithms and mathematical programming computational geometry and polyhedral combinatorics All these topics are related and they are all addressed in this book Combinatorial optimization is also known for its numerous applications To limit the scope however this book is not primarily about applications although some are mentioned at various places Most papers in this volume are surveys that provide an excellent overview of an active research area but this book also contains many new results Highlighting many of the currently most interesting research directions in combinatorial optimization we hope that this book constitutes a good basis for future research in these areas

Annotated Bibliographies in Combinatorial Optimization Mauro Dell'Amico, Francesco Maffioli, Silvano Martello, 1997-08-28 Wiley Interscience Series in Discrete Mathematics and Optimization Advisory Editors Ronald L Graham Jan Karel Lenstra Robert E Tarjan

Discrete Mathematics and Optimization involves the study of finite structures and is one of the fastest growing areas in mathematics today. The level and depth of recent advances in the area and the wide applicability of its evolving techniques point to the rapidity with which the field is moving and presage the ever increasing interaction between it and computer science. The Series provides a broad coverage of discrete mathematics and optimization ranging over such fields as combinatorics, graph theory, enumeration, mathematical programming and the analysis of algorithms and including such topics as Ramsey theory, transversal theory, block designs, finite geometries, Polya theory, graph and matroid algorithms, network flows, polyhedral combinatorics and computational complexity. The Wiley Interscience Series in Discrete Mathematics and Optimization will be a substantial part of the record in this extraordinary development. Recent titles in the Series: Local Search in Combinatorial Optimization Edited by Emile H. L. Aarts, Philips Research Laboratories, Eindhoven and Eindhoven University of Technology; Jan Karel Lenstra, Eindhoven University of Technology and CWI, Amsterdam. In the past three decades, local search has grown from a simple heuristic idea into a mature field of research in combinatorial optimization. Local search is still the method of choice for NP hard problems as it provides a robust approach for obtaining high quality solutions to problems of a realistic size in a reasonable time. This area of discrete mathematics is of great practical use and is attracting ever increasing attention. The contributions to this book cover local search and its variants from both a theoretical and practical point of view, each with a chapter written by leading authorities on that particular aspect. Chapters 1 to 7 deal with the theory of local search and describe the principal search strategies such as simulated annealing, tabu search, genetic algorithms and neural networks. The remaining chapters present a wealth of results on applications of local search to problems in management science and engineering including the traveling salesman problem, vehicle routing, machine scheduling, VLSI design and code design. This book is an important reference volume and an invaluable source of inspiration for advanced students and researchers in discrete mathematics, computer science, operations research, industrial engineering and management science.
