Combustion Irvin Glassman,Richard A. Yetter,2008-10-22 Combustion Engineering a topic generally taught at the upper undergraduate and graduate level in most mechanical engineering programs and many chemical engineering programs is the study of rapid energy and mass transfer usually through the common physical phenomena of flame oxidation It covers the physics and chemistry of this process and the engineering applications from the generation of power such as the internal combustion automobile engine to the gas turbine engine Renewed concerns about energy efficiency and fuel costs along with continued concerns over toxic and particulate emissions have kept the interest in this vital area of engineering high and brought about new developments in both fundamental knowledge of flame and combustion physics as well as new technologies for flame and fuel control New chapter on new combustion concepts and technologies including discussion on

nanotechnology as related to combustion as well as microgravity combustion microcombustion and catalytic combustion all interrelated and discussed by considering scaling issues e g length and time scales New information on sensitivity analysis of reaction mechanisms and generation and application of reduced mechanisms Expanded coverage of turbulent reactive flows to better illustrate real world applications Important new sections on stabilization of diffusion flames For the first time the concept of triple flames will be introduced and discussed in the context of diffusion flame stabilization **Aeronautical**
