This book presents a novel account of the human temporal dimension called the human temporality and develops a special mathematical formalism for describing such an object as the human mind One of the characteristic features of the human mind is its temporal extent For objects of physical reality only the present exists which may be conceived as a point like moment in time In the human temporality the past retained in the memory the imaginary future and the present coexist and are closely intertwined and impact one another This book focuses on one of the fragments of the human temporality called the complex present A detailed analysis of the classical and modern concepts has enabled the authors to put forward the idea of the multi component structure of the present For the concept of the complex present the authors proposed a novel account that involves a qualitative description and a special mathematical formalism This formalism takes into account human goal oriented behavior and uncertainty in human perception The present book can be interesting for theoreticians physicists dealing with modeling systems where the human factor plays a crucial role philosophers who are interested in applying philosophical concepts to constructing mathematical models and psychologists whose research is related to modeling mental processes      **21st Century Parenting** Rick Capaldi,2019-08-06 The only parenting book based on a school tested method

**Space in Diachrony** Silvia Luraghi, Tatiana Nikitina, Chiara Zanchi, 2017-08-14 Space is a fundamental dimension of human life and is pervasive in human experience Research on space has highlighted the possible asymmetrical nature of spatial relations Differences in the encoding of goals and sources of motion are a case in point and cross linguistic coding tendencies show that path is less frequently flagged by a dedicated case than goal source origin and static location locative Interestingly such asymmetries may correlate with certain types of landmark as in the case of toponyms or of animate entities Even though these issues have been focused upon both in typological and psycholinguistic research they remain largely open The papers in this collection aim to show that a diachronic approach may shed light on the way in which asymmetries in the space domain come about over time thus contributing to the clarification of synchronically puzzling facts

**Transparency and Interpretability for Learned Representations of Artificial Neural Networks**

Richard Meyes, 2022-11-26 Artificial intelligence AI is a concept whose meaning and perception has changed considerably over the last decades Starting off with individual and purely theoretical research efforts in the 1950s AI has grown into a fully developed research field of modern times and may arguably emerge as one of the most important technological advancements of mankind Despite these rapid technological advancements some key questions revolving around the matter of transparency interpretability and explainability of an AI's decision making remain unanswered Thus a young research field coined with the general term Explainable AI XAI has emerged from increasingly strict requirements for AI to be used in safety critical or ethically sensitive domains An important research branch of XAI is to develop methods that help to facilitate a deeper understanding for the learned knowledge of artificial neural systems In this book a series of scientific studies are presented that shed light on how to adopt an empirical neuroscience inspired approach to investigate a neural network's learned representation in the same spirit as neuroscientific studies of the brain
