Topological Strings and Quantum Curves Lotte Hollands, 2009 This thesis presents several new insights on the interface between mathematics and theoretical physics with a central role for Riemann surfaces First of all the duality between Vafa Witten theory and WZW models is embedded in string theory Secondly this model is generalized to a web of dualities connecting topological string theory and $N=2$ supersymmetric gauge theories to a configuration of D branes that intersect over a Riemann surface This description yields a new perspective on topological string theory in terms of a KP integrable system based on a quantum curve Thirdly this thesis describes a geometric analysis of wall crossing in $N=4$ string theory And lastly it offers a novel approach to construct metastable vacua in type IIB string theory
