

back at an angle proceeding at a slow speed. As the bow of the boat nears the dock, pull into reverse and the stern will swing to port, toward the dock, bringing the boat into its position. To approach and near the boat to the dock on the starboard side, the same procedure is used except the shifting lever is left in the forward position. Forward motion can be checked by using reverse and turning the rudder hard over to port.

When docking, the effect of winds and currents must be taken into consideration. A wind blowing toward the dock can be used to help drift the boat into position. If the wind is blowing away from the dock hard enough, it may become necessary to cast the motor by line to someone on the dock, if possible, dock against the current.

## ANCHORING

When dropping an anchor lower it slowly over the side, take first, if an anchor is thrown overboard, it may quite easily become hooked in the line and, consequently, lose its holding power. The length of line or scope to use depends largely upon weather conditions, size of boat, and the type of bottom. An anchor will hold quite well in mud but will drag easily through sand. If there is a rocky bottom the anchor can usually secure itself well, in fact, but will in some cases, if you give a rocky area a loose-rod line will permit the anchor to be hooked up close but if hooked under a rock. Most government charts indicate the type of bottom to be found.

The scope, which is the distance of line measured from the bow to the anchor, is generally of sufficient length if it is from four (4) to eight (8) times the depth of the water, depending upon prevailing conditions.

After the anchor is down you must test determine if the anchor is "dragging". Take bearings using as many stationary objects on land as you can. The further the distance the checkpoints are from the boat, the better. As you recheck the bearings, note if they are changing. If they are, then you know the anchor is dragging and you must correct the situation. This can usually be accomplished by letting out more line.

Correct method of dropping anchor

## AIDS TO NAVIGATION

The location of red and black buoys are often confusing to the novice boat operator. The plan by which they are positioned is fully explained in the "Coast Guard Pilot Rules Handbook". However, the following information is given to familiarize the boater with buoy colors and positions.

Red and black buoys are generally the most frequently sighted when entering a channel. The red buoy denotes the right hand side of the channel, and the black buoy denotes the left, entering from seaward.

As you proceed from seaward, the buoys will be numbered. The buoys to your port, or black buoys, will begin with the number 1 and continue with odd numbers while the first starboard buoy will be number 2 and continue with even numbers.

The common expression "red right returning" is used as a guide to one traveling near the Red buoy will be on the right (starboard) side when returning from seaward.

Red and black buoy systems are usually located near a particular set of channels.
