GASTROESOPHAGEAL REFLUX DISEASE

A NEW HISTOLOGY-BASED METHOD

Kitai Kim, Bernard Naylor

Diagnostic Atlas of Gastroesophageal Reflux Disease Parakrama T. Chandrasoma, 2011-08-29 Gastroesophageal reflux is one of the most common maladies of mankind Approximately 40% of the adult population of the USA suffers from significant heartburn and the numerous antacids advertised incessantly on national television represents a 8 billion per year drug market The ability to control acid secretion with the increasingly effective acid suppressive agents such as the H2 blockers pepcid zantac and proton pump inhibitors nexium prevacid has given physicians an excellent method of treating the symptoms of acid reflux Unfortunately this has not eradicated reflux disease It has just changed its nature While heartburn ulceration and strictures have become rare reflux induced adenocarcinoma of the esophagus is becoming increasingly common Adenocarcinoma of the esophagus and gastric cardia is now the most rapidly increasing cancer type in the Western world At present there is no histologic test that has any practical value in the diagnosis of reflux disease The only histologic diagnostic criteria are related to changes in the squamous epithelium which are too insensitive and nonspecific for effective patient management It is widely recognized that columnar metaplasia of the esophagus manifest histologically as cardiac oxyntocardiac and intestinal epithelia is caused by reflux However except for intestinal metaplasia which is diagnostic for Barrett esophagus these columnar epithelia are not used to diagnose reflux disease in biopsies The reason for this is that these epithelial types are indistinguishable from normal gastric cardiac mucosa In standard histology texts this normal gastric cardia is 2 3 cm long In the mid 1990s Dr Chandrasoma and his team at USC produced autopsy data suggesting that cardiac and oxyntocardiac mucosa is normally absent from this region and that their presence in biopsies was histologic evidence of reflux disease From this data they determined that the presence of cardiac mucosa was a pathologic entity caused by reflux and could therefore be used as a highly specific and sensitive diagnostic criterion for the histologic diagnosis of reflux disease They call this entity reflux carditis In addition the length of these metaplastic columnar epithelia in the esophagus was an accurate measure of the severity of reflux disease in a given patient At present there is some controversy over whether cardiac mucosa is totally absent or present normally to the extent of 0 4 mm While this should not be a deterrent to changing criteria which are dependent on there normally being 20 30 cm of cardiac mucosa there has been little mainstream attempt to change existing endoscopic and pathologic diagnostic criteria in the mainstream of either gastroenterology or pathology The ATLAS will be the source of easily digestible practical information for pathologists faced with biopsies from this region It will also guide gastroenterologists as they biopsy these patients The American Gastroenterological Association claims there are 14 500 members worldwide who are practicing physicians and scientists who research diagnose and treat disorders of the gastrointestinal tract and liver According to the American Society for Clinical Pathology there are 12 000 board certified pathologists in the U S Adenocarcinoma of the esophagus and gastric cardia is now the most rapidly increasing cancer type in the Western world Approximately 40% of the adult population of the U S suffers from significant heartburn and the numerous antacids advertised on national television represents an 8 billion Shackelford's Surgery of the Alimentary Tract E-Book Charles J. Chandrasoma, 2017-10-26 GERD A New Understanding of Pathology Pathophysiology and Treatment transforms the assessment of gastroesophageal reflux disease GERD from its present state which is largely dependent on clinical definition and management to a more objective scientific basis that depends on pathologic assessment Sequential chapters in this single author book describe the fetal development of the esophagus the normal adult state and the way exposure to gastric juice causes epithelial and lower esophageal sphincter damage at a cellular level It allows recognition of the pathologic manifestations of lower esophageal sphincter damage and develops new histopathologic criteria for quantitating such damage This understanding provides new pathologic criteria for definition and diagnosis of GERD from its earliest cellular stage Algorithms based on measurement of sphincter damage can identify even before the onset of clinical

GERD persons who will never develop GERD during life those who develop GERD but remain with mild and easily controlled disease and those who will progress to severe GERD with failure to control symptoms Barrett esophagus and adenocarcinoma Aggressive early intervention in the last group with the objective of preventing disease progression to its end points of uncontrolled symptoms and adenocarcinoma becomes feasible Provides a new method of assessment of GERD that has never previously been presented creating a pathway to control Describes a new pathologic test based on standard histology that can define lower esophageal sphincter damage Sequential chapters outline the way GERD progresses from the perspective of the amount of damage to the lower esophageal sphincter Provides new avenues of clinical research and technologic innovations in pathology and treatment aimed at preventing esophageal adenocarcinoma Gastrointestinal Disease W.
