and molecular biology and chemistry have lead to the development in of a new branch of toxicology called Computational Toxicology This emerging field is addressing the estimation and prediction of exposure risk and effects of chemicals based on experimental data measured concentration and biological mechanisms and computational models of biological systems Mathematical models are also being used to predict the fate and transport of substances in the environment Because this area is still in its infancy there has been limited application from governmental agencies to regulating controllable processes such as registration of new chemicals determination of estimated exposure and risk based limits and maximum acceptable concentrations in different compartments of the environment ambient air waters soil and food products However this is soon to change as the ability to collect analyze and interpret the required information is becoming increasingly more efficient and cost effective Full implementation of the new processes have to involve education on both part of the experimentalists who are generating the data and the models and the risk assessors who will use them to better protect human health and the environment

Environmental Chemistry for a Sustainable World Eric Lichtfouse, Jan Schwarzbauer, Didier Robert, 2011-11-27 Environmental chemistry is a fast developing science aimed at deciphering fundamental mechanisms ruling the behaviour of pollutants in ecosystems Applying this knowledge to current environmental issues leads to the remediation of environmental media and to new low energy low emission sustainable processes Nanotechnology applications for alternative energies such as solar power fuel cells hydrogen and lithium batteries are reviewed in the first section Recent investigations on carbon nanotubes nanocatalysts and cyclodextrins disclose unprecedented techniques to monitor and clean pollutants such as greenhouse gases heavy metals pesticides pathogens occurring in water air and soil The second section reviews the risks for human health of critical pollutants such as endocrine disruptors dioxins and heavy metals contaminating seafood and sediments An exhaustive review of DDT isomers reveals unexpected mechanisms of DDT transfer to fishes A chapter on pollutant geochronology using river sedimentary archives provides novel insights on pollution history since the beginning of the anthropocene This book will be a valuable source of information for engineers and students developing novel applied techniques to monitor and clean pollutants in air wastewater soils and sediments
