**Stochastic Epidemic Models and Their Statistical Analysis** Hakan Andersson, Tom Britton, 2012-12-06 The present lecture notes describe stochastic epidemic models and methods for their statistical analysis Our aim is to present ideas for such models and methods for their analysis along the way we make practical use of several probabilistic and statistical techniques This will be done without focusing on any specific disease and instead rigorously analyzing rather simple models The reader of these lecture notes could thus have a two fold purpose in mind to learn about epidemic models and their statistical analysis and or to learn and apply techniques in probability and statistics The lecture notes require an early graduate level knowledge of probability and They introduce several techniques which might be new to students but our statistics intention is to present these keeping the technical level at a minimum Techniques that are explained and applied in the lecture notes are for example coupling diffusion approximation random graphs likelihood theory for counting processes martingales the EM algorithm and MCMC methods The aim is to introduce and apply these techniques thus hopefully motivating their further theoretical treatment A few sections mainly in Chapter 5 assume some knowledge of weak convergence we hope that readers not familiar with this theory can understand the these parts at a heuristic level The text is

divided into two distinct but related parts modelling and estimation      Stochastic Epidemic Models with Inference Tom Britton, Etienne Pardoux, 2019-11-30 Focussing on stochastic models for the spread of infectious diseases in a human population this book is the outcome of a two week ICPAM CIMPA school on Stochastic models of epidemics which took place in Ziguinchor Senegal December 5 16 2015 The text is divided into four parts each based on one of the courses given at the school homogeneous models Tom Britton and Etienne Pardoux two level mixing models David Sirl and Frank Ball epidemics on graphs Viet Chi Tran and statistics for epidemic models Catherine Lar do The CIMPA school was aimed at PhD students and Post Docs in the mathematical sciences Parts or all of this book can be used as the basis for traditional or individual reading courses on the topic For this reason examples and exercises some with solutions are provided throughout

Xue-Zhi Li, Junyuan Yang, Maia Martcheva, 2020-05-28 This book introduces advanced mathematical methods and techniques for analysis and simulation of models in mathematical epidemiology Chronological age and class age play an important role in the description of infectious diseases and this text provides the tools for the analysis of this type of partial differential equation models This book presents general theoretical tools as well as large number of specific examples to guide the reader to develop their own tools that they may then apply to study structured models in mathematical epidemiology The book will be a valuable addition to the arsenal of all researchers interested in developing theory or studying specific models with age structure      Identifiability and Observability in Epidemiological Models Nik Cuniffe, Frédéric

Hamelin, Abderrahman Iggidr, Alain Rapaport, Gauthier Sallet, 2024-07-02 This book introduces the concepts of identifiability and observability in mathematical epidemiology as well as those of observers constructions It first exposes and illustrates on several examples the mathematical definitions and properties of observability and identifiability A chapter is dedicated to the

well known Kermack McKendrick model for which the complete analysis of identifiability and observability is not available in the literature. Then several techniques of observer constructions in view of online estimation of state and parameters are presented and deployed on several models. New developments relevant for applications in epidemiology are also given. Finally practical considerations are discussed with data and numerical simulations related to models previously analysed in the book. The book will be appealing to epidemiological modellers and mathematicians working on models in epidemiology. This book contributes to Sustainable Development Goal 3 SDG3 Good Health and Well Being.

**Mathematical Epidemiology of Infectious Diseases** O. Diekmann, J. A. P. Heesterbeek, 2000-04-07 Mathematical Epidemiology of Infectious Diseases Model Building Analysis and Interpretation O Diekmann University of Utrecht The Netherlands J A P Heesterbeek Centre for Biometry Wageningen The Netherlands The mathematical modelling of epidemics in populations is a vast and important area of study. It is about translating biological assumptions into mathematics, about mathematical analysis aided by interpretation and about obtaining insight into epidemic phenomena when translating mathematical results back into population biology. Model assumptions are formulated in terms of usually stochastic behaviour of individuals and then the resulting phenomena at the population level are unravelled. Conceptual clarity is attained, assumptions are stated clearly, hidden working hypotheses are attained and mechanistic links between different observables are exposed. Features: Model construction, analysis and interpretation receive detailed attention. Uniquely covers both deterministic and stochastic viewpoints. Examples of applications given throughout. Extensive coverage of the latest research into the mathematical modelling of epidemics of infectious diseases. Provides a solid foundation of modelling skills. The reader will learn to translate model, analyse and interpret with the help of the numerous exercises. In literally working through this text, the reader acquires modelling skills that are also valuable outside of epidemiology, certainly within population dynamics but even beyond that. In addition, the reader receives training in mathematical argumentation. The text is aimed at applied mathematicians with an interest in population biology and epidemiology, at theoretical biologists and epidemiologists. Previous exposure to epidemic concepts is not required as all background information is given. The book is primarily aimed at self study and ideally suited for small discussion groups or for use as a course text.

A lot of attention is paid to the qualitative analysis of models, the sheer variety of models and the frontiers of mathematical epidemiology. The process and key steps in epidemiological modeling and prediction are highlighted using transmission models of HIV/AIDS, SARS and tuberculosis as application examples.
