

many people who undergo epilepsy surgery have low memory functioning on presurgery tests, and further decline below presurgery levels may not be possible in some people (Baxendale et al., 2012).

Research Gaps

Currently, there is insufficient knowledge about cognitive impairment in epilepsy, including its timing, its prognosis, and to what extent refractory epilepsy causes cognitive decline over time (Hermann and Seidenberg, 2007). Much of the published work is cross-sectional; such studies have several methodological problems that preclude them from clearly elucidating the cognitive course of people with epilepsy. These shortcomings include the studies' inability to evaluate cognitive status over time and to account for cohort effects. Further, research on epilepsy and cognitive disorders has, for the most part, been descriptive rather than explanatory (Hermann and Seidenberg, 2007). The few prospective studies that have sought to identify the etiology of cognitive impairment in people with epilepsy also have methodological shortcomings, such as evaluating cognitive status only through assessments of IQ, use of cohorts that have a mixture of seizure types, lack of appropriate control groups, absence of baseline data, polypharmacy, varying test-retest intervals, and relatively short follow-up periods (Bhise et al., 2010).

Analysis of cognitive decline in children with epilepsy is particularly difficult given the extremely small number of studies that have used comprehensive neuropsychological test batteries (Vingerhoets, 2006). The course of cognition in middle-aged and older adults with chronic epilepsy has been even less studied (Hermann et al., 2008b). Limitations in the few long-term studies of outcomes after epilepsy surgery include failure to include an adequate control group; not reporting on outcomes beyond seizure-related measures, such as cognitive outcomes over a period longer than 5 years; and a focus on temporal lobe epilepsy (Téllez-Zenteno et al., 2007a).

For these reasons, a large-scale, well-designed epidemiologic study on cognitive impairment in epilepsy is a research priority. This might be achieved though the addition of questions on cognitive impairment in surveys such as the CDC's BRFSS. In addition, people with epilepsy who are already experiencing cognitive decline need to be identified and referred to specialists in order to try to halt additional impairment (Chapter 4). School performance can be used to identify children at high risk for attention and behavior problems early on, allowing appropriate management to begin (Bhise et al., 2010).

Future longitudinal prospective investigations are needed to accurately describe seizure type and frequency and compare cognitive effects in groups

Achieving Equity in Neurological Practice Bruce Ovbiagele, Sharon Lewis, Daniel José Correa, Reena Thomas, Larry Charleston IV, 2024-10-22 The recent high profile murders of George Floyd and other African American individuals along with the prevailing coronavirus disease COVID 19 pandemic have reinforced the notion that certain marginalized populations have worse health outcomes than other populations likely due to unequal and unjust policies and practices Neurological processes and prognoses frequently vary by sex gender race ethnicity socioeconomic status and geographic location In particular individuals of lower socioeconomic status and from minority racial and ethnic backgrounds have worse neurological health and often receive a lower standard of neurological care These inequities in neurological outcomes are attributed to wider societal social influences which impact how people live and how neurology is practiced Published evidence suggests that healthcare providers and the healthcare system contribute to inequities in neurological care for vulnerable and underserved populations However educating neurology care providers about these issues and training them to provide equitable care for these patients can potentially improve neurology care access delivery and outcomes In this book we provide the theoretical background scientific evidence and experiential knowledge warranted to properly care for vulnerable underserved patients with neurological diseases at the levels of the provider and system This book examines the root causes of neurological health inequities across a broad range of topics and offers possible solutions for achieving neurological health equity Initial chapters help to frame the overall issue of neurological health equity Subsequent chapters evaluate neurological health equity from the clinical practice standpoint with a focus on select populations and subspecialty care delivery settings Lastly we discuss the bigger picture with regard to the pipeline of practitioners and purview of policy makers This text is relevant for neurology residents and fellows multidisciplinary neurological care practitioners neurologists neurosurgeons advanced practice providers hospitalists emergency physicians critical care physicians pharmacists and allied health personnel and public health researchers and health policy makers The book is divided into three sections Principles Neurological Conditions and Priorities The first section establishes the framework and explains various key terminologies and concepts which undergird the care of vulnerable and underserved patient populations The second section Neurological Conditions covers key

neurological diseases by sub specialty describing published evidence of care and outcome disparities gaps in knowledge practical techniques for bridging these disparities on provider and system levels The third section Priorities identifies important areas of focus and improvement targeting trainees researchers community partners stakeholder organizations and policy makers which would be crucial for implementing sustained societal level enhancements in the neurological health of these vulnerable populations
