Coding Spreading Tradeoff In Cdma Systems:

Coding-Spreading Tradeoff in CDMA Systems Eduardo J. Bolas,2002-09-01 In this thesis we investigate the usage of low rate codes primarily to provide the total bandwidth expansion required for a CDMA system Comparing different combinations of coding and spreading with a traditional DS CDMA as defined in the IS 95 standard allows the criteria to be defined for the best coding spreading tradeoff in CDMA systems The analysis of the coding spreading tradeoff is divided into two parts The first part is dedicated to the study of the deterministic components of the problem This includes the different factors with non random behavior that the system s designer can determine The processing gain the code characteristics and the number of users are well defined variables that can determine the overall performance and can consequently affect the tradeoff The second part of the study is dedicated to analyzing different combinations of coding and spreading with no ideal channel estimation and interference reduction techniques Small scale fading channel conditions are emulated through Nakagami m distribution Large scale path loss was incorporated through the extended Hata model while Lognormal shadowing considered the fluctuations on the received power at points with the same distance to the transmitter We assessed the performance of different combinations of coding and spreading considering in two cases a worst case scenario in which the mobile user was located at the corner of a hexagon cell in a seven cell cluster and a more realistic scenario in which the user could be physically located anywhere in the cell following a uniform probability distribution function Furthermore we investigated the improvement in performance generated by interference reduction techniques such as sectoring and power control **THE CODING-SPREADING TRADEOFF PROBLEM IN FINITE-SIZED SYNCHRONOUS DS-CDMA SYSTEMS.** ,2005 This dissertation provides a comprehensive analysis of the coding spreading tradeoff problem in finite sized synchronous DS CDMA systems In contrast to the large system which has a large number of users the finite sized system refers to a system with a small number of users Much work has been performed in the past on the analysis of the spectral efficiency of synchronous DS CDMA systems and the associated coding spreading tradeoff problem However most of the analysis is based on the large system assumptions In this dissertation we focused on finite sized systems with the help of numerical methods and Monte Carlo simulations Binary input achievable information rates for finite sized synchronous DS CDMA systems with different detection decoding schemes on AWGN channel are numerically calculated for various coding spreading apportionments We use these results to determine the existence and value of an optimal code rate for a number of different multiuser receivers where optimality is in the sense of minimizing the SNR required for reliable multiuser communication Our results are consistent with the well known fact that all coding no spreading is optimal for the maximum a posteriori receiver Simulations of the LDPC coded synchronous DS CDMA systems with iterative multiuser detection decoding and MMSE multiuser detection single user decoding are also presented to show that the binary input capacities can be closely approached with practical schemes The coding spreading tradeoff is examined using these LDPC code simulation

results where agreement with the information theoretic results is demonstrated We extend our work to the DS CDMA systems on two idealized Rayleigh flat fading channels the chip level flat fading CLFF and the code symbol level flat fading SLFF These models represent ideal fast fading and slow fading channels respectively Both information theoretic results and LDPC code simulation results are presented to show the effects of channel fading on system performance and the coding spreading tradeoff It is shown that fast fading can be beneficial to system performance under the condition of perfect channel state information at receiver but slow fading is very harmful Slow fading also increases the importance of coding greatly compared to the AWGN and fast fading Finally we present some comparisons with large system results on AWGN and CLFF channels which show both consistencies and discrepancies **Information Theory and Coding for Spread Spectrum Communication Systems** Mehul Motani,2000 **CDMA Techniques for Third Generation Mobile Systems** Francis Swarts,1999 CDMA Techniques for Third Generation Mobile Systems presents advanced techniques for analyzing and developing third generation mobile telecommunication systems Coverage includes analysis of CDMA based systems multi user receivers Turbo coding for mobile radio applications spatial and temporal processing techniques as well as software radio techniques Special emphasis has been given to recent advances in coding techniques smart antenna systems spatial filtering and software implementation issues Internationally recognized specialists contributed to this volume and each chapter has been reviewed and edited for uniformity CDMA Techniques for Third Generation Mobile Systems is an invaluable reference work for engineers and researchers involved in the development of specific CDMA systems **Bandwidth Allocation and Tradeoffs of Source Coding, Channel Coding and Spreading in CDMA Systems** Qinghua Zhao,2004 Signal Processing for Wireless Communication Systems H. Anderson,Arne Svensson,2006-04-11 Coded Modulation Systems is an introduction to the subject of coded modulation in digital

communication It is designed for classroom use and for anyone wanting to learn the ideas behind this modern kind of coding Coded modulation is signal encoding that takes into account the nature of the channel over which it is used Traditional error correcting codes work with bits and add redundant bits in order to correct transmission errors In coded modulation continuous time signals and their phases and amplitudes play the major role The coding can be seen as a patterning of these quantities The object is still to correct errors but more fundamentally it is to conserve signal energy and bandwidth at a given error performance The book divides coded modulation into three major parts Trellis coded modulation TCM schemes encode the points of QAM constellations lattice coding and set partition techniques play major roles here Continuous phase modulation CPM codes encode the signal phase and create constant envelope RF signals The partial response signaling PRS field includes intersymbol interference problems signals generated by real convolution and signals created by lowpass filtering In addition to these topics the book covers coding techniques of several kinds for fading channels spread spectrum and repeat request systems The history of the subject is fully traced back to the formative work of Shannon in 1949 Full explanation of the basics and complete homework problems make the book ideal for self study or classroom use

Multi-Carrier Spread-Spectrum Khaled Fazel,Stefan Kaiser,2006-02-23 The benefits and success of multi carrier MC modulation on one side and the flexibility offered by the spread spectrum SS technique on the other side have motivated many researchers to investigate the combination of both techniques since 1993 This combination known as multi carrier spread spectrum MC SS benefits from the advantages of both systems and offers high flexibility high spectral efficiency simple detection strategies narrow band interference rejection capability etc The basic principle of this combination is straightforward The spreading is performed as direct sequence spread spectrum DS SS but instead of transmitting the chips over a single carrier several sub carriers are employed The MC modulation and demodulation can easily be realized in the digital domain by performing IFFT and FFT operations The separation of the users signals can be performed in the code domain MC SS systems can perform the spreading in frequency direction which allows for simple signal detection strategies Since 1993 MC SS has been deeply studied and new alternative solutions have been proposed Meanwhile deep system analysis and comparison with DS CDMA have been performed that show the superiority of MC CDMA The aim of Multi Carrier Spread Spectrum is to edit the ensemble of the newest contributions and research results in this new field that have been presented during the 5th International Workshop on Multi Carrier Spread Spectrum MC SS 2005 held in Oberpfaffenhofen Germany **IEEE International Conference on Personal Wireless Communications** ,2000

Multi-Carrier and Spread Spectrum Systems K. Fazel,S. Kaiser,2004-02-06 Frequency spectrum is a limited and valuable resource for wireless communications A good example can be observed among network operators in Europe for the

prices to pay for UMTS frequency bands Therefore the first goal when designing future wireless communication systems e g 4G fourth generation has to be the increase in spectral efficiency The development in digital communications in the past years has enabled efficient modulation and coding techniques for robust and spectral efficient data speech audio and video transmission These are the multi carrier modulation e g OFDM and the spread spectrum technique e g DS CDMA where OFDM was chosen for broadcast applications DVB DAB as well as for broadband wireless indoor standards ETSI HIPERLAN II IEEE 802 11 and the DS CDMA was selected in mobile communications IS 95 third generation mobile radio systems world wide UMTS IMT 2000 Since 1993 various combinations of multi carrier MC modulation and the spread spectrum SS technique have been introduced and the field of MC SS communications has become an independent and important research topic with increasing activities New application fields have been proposed such as high rate cellular mobile high rate wireless indoor and LMDS It has been shown that MC SS offers the high spectral efficiency robustness and flexibility that is required for the next generation systems Meanwhile different alternative hybrid schemes such as OFDM OFDMA MC TDMA etc have been deeply analysed and adopted in different international standards ETSI BRAN IEEE 802 MMAC Multi Carrier Spread Spectrum Analysis of Hybrid Air Interfaces draws together all of the above mentioned hybrid schemes therefore providing a greatly needed resource for system engineers telecommunication designers and researchers in order to enable them to develop build and deploy several schemes based on MC transmission for the next generation systems which will be an integration of broadband multimedia services covering both 4G mobile and fixed wireless systems Offers a complete treatment of multi carrier spread spectrum SS and time division multiplexing TDM techniques Provides an in depth insight into hybrid multiple access techniques based on multi carrier MC transmission Presents numerous hybrid multiple access and air interface architectures including OFDM CDMA MC CDMA MC DS CDMA and MT CDMA Covers new techniques such as space time coding and software radio Telecommunications engineers hardware software system designers and researchers as well as students lecturers and technicians will all find this an invaluable addition to their bookshelf
