G. Upton, 2016-10-24 Introduces the key concepts in the analysis of categorical data with illustrative examples and accompanying R code This book is aimed at all those who wish to discover how to analyze

categorical data without getting immersed in complicated mathematics and without needing to wade through a large amount of prose. It is aimed at researchers with their own data ready to be analyzed and at students who would like an approachable alternative view of the subject. Each new topic in categorical data analysis is illustrated with an example that readers can apply to their own sets of data. In many cases R code is given and excerpts from the resulting output are presented. In the context of log linear models for cross tabulations two specialties of the house have been included: the use of cobweb diagrams to get visual information concerning significant interactions and a procedure for detecting outlier category combinations. The R code used for these is available and may be freely adapted. In addition this book uses an example to illustrate each new topic in categorical data. Provides a clear explanation of an important subject. Is understandable to most readers with minimal statistical and mathematical backgrounds. Contains examples that are accompanied by R code and resulting output. Includes starred sections that provide more background details for interested readers. Categorical Data Analysis by Example is a reference for students in statistics and researchers in other disciplines especially the social sciences who use categorical data. This book is also a reference for practitioners in market research, medicine and other fields. The Analysis of Cross-Classified Categorical Data Stephen E. Fienberg, 2007-07-30. Until recent years the statistical and computational techniques available for the analysis of cross classified data were quite limited. This book presents some of the recent work on the statistical analysis of cross classified data using loglinear models. **Applied Categorical Data Analysis and Translational Research** Chap T. With its easy to follow style, updated coverage of major methodologies and broadened scope of coverage, this new edition provides an accessible guide to statistical methods involving categorical data and the steps to their application in problem solving in the biomedical sciences. Delving even further into the applied direction, this update offers many real world examples from biomedicine, epidemiology and public health along with detailed case studies taken straight from modern research in these fields. Additional features of the Second Edition include: A new chapter on the relationship between translational research and categorical data focusing on design, study, bioassay and Phase I and Phase II clinical trials. A new chapter on categorical data and diagnostic medicine with coverage of the diagnostic process, prevalence surveys, the ROC function and ROC curve and important statistical considerations. A revised chapter on logistic regression models featuring an updated treatment of simple and multiple regression analysis. An added section on quantal bioassays. Each chapter features updated and new exercise sets along with numerous graphs that demonstrate the highly visual nature of the topic. A related Web site features the book's examples as well as additional data sets that can be worked with using SAS software. The only

Categorical Data Analysis for the Behavioral and Social Sciences Razia Azen, Cindy M. Walker, 2011-01-07 Featuring a practical approach with numerous examples this book focuses on helping the reader develop a conceptual rather than technical understanding of categorical methods making it a much more accessible text than others on the market The authors cover common categorical analyses and emphasize specific research questions that can be addressed by each analytic procedure so that readers are able to address the research questions they wish to answer To achieve this goal the authors Review the theoretical implications and assumptions underlying each of the procedures Present each concept in general terms and illustrate each with a practical example Demonstrate the analyses using SPSS and SAS and show the

interpretation of the results provided by these programs A Look Ahead section at the beginning of each chapter provides an overview of the material covered so that the reader knows what to expect This is followed by one or more research questions that can be addressed using the procedures covered in the chapter A theoretical presentation of the material is provided and illustrated using realistic examples from the behavioral and social sciences To further enhance accessibility the new procedures introduced in the book are explicitly related to analytic procedures covered in earlier statistics courses such as ANOVA and linear regression Throughout each chapter the authors use practical examples to demonstrate how to obtain and interpret statistical output in both SPSS and SAS Their emphasis on the relationship between the initial research question the use of the software to carry out the analysis and the interpretation of the output as it relates to the initial research question allows readers to easily apply the material to their own research The data sets for executing chapter examples using SAS Version 9 1 3 and or IBM SPSS Version 18 are available on a book specific web site These data sets and syntax allow readers to quickly run the programs and obtain the appropriate output The book also includes both conceptual and analytic end of chapter exercises to assist instructors and students in evaluating the understanding of the material covered in each chapter This book covers the most commonly used categorical data analysis procedures It is written for those without an extensive mathematical background and is ideal for graduate courses in categorical data analysis or cross classified data analysis taught in departments of psychology human development family studies sociology education and business Researchers in these disciplines interested in applying these procedures to their own research will appreciate this book's accessible approach

The Statistical Analysis of Categorical Data Erling B. Andersen, 2012-12-06 The aim of this book is to give an up to date account of the most commonly used statistical models for categorical data The emphasis is on the connection between theory and applications to real data sets The book only covers models for categorical data Various models for mixed continuous and categorical data are thus excluded The book is written as a textbook although many methods and results are quite recent This should imply that the book can be used for a graduate course in categorical data analysis With this aim in mind chapters 3 to 12 are concluded with a set of exercises In many cases the data sets are those data sets which were not included in the examples of the book although they at one point in time were regarded as potential candidates for an example A certain amount of general knowledge of statistical theory is necessary to fully benefit from the book A summary of the basic statistical concepts deemed necessary prerequisites is given in chapter 2 The mathematical level is only moderately high but the account in chapter 3 of basic properties of exponential families and the parametric multivariate distribution is made as mathematically precise as possible without going into mathematical details and leaving out most proofs
