Flemings, 2021-03-25 Geopressure drives fluid flow and is important for hydrocarbon exploration carbon sequestration and designing safe and economical wells This concise guide explores the origins of geopressure and presents a step by step approach to characterizing and predicting pressure and least principal stress in the subsurface The book emphasizes how geology and particularly the role of flow along permeable layers drives the development and

distribution of subsurface pressure and stress Case studies such as the Deepwater Horizon blowout and laboratory experiments are used throughout to demonstrate methods and applications It succinctly discusses the role of elastoplastic behaviour the full stress tensor and diagenesis in pore pressure generation and it presents workflows to predict pressure stress and hydrocarbon entrapment It is an essential guide for academics and professional geoscientists and petroleum engineers interested in predicting pressure and stress and understanding the role of geopressure in geological processes well design hydrocarbon entrapment and carbon sequestration

 project in Hong Kong The project involves excavation materials disposal and slope stabilization works for subsequent housing
 and public facilities developments The site formation work has produced excellent outcrops during the construction stage
 This has also provided us a valuable chance to study the engineering geology of the site Geological mapping of the site and
 rock joint survey has been carried out in selected rock slopes The field data was then being analysis by the technique of
 stereographic projection The field descriptions were presented as notes on the engineering geology plan and block diagram
 Two units of granite were identified The two granite units are different in their colour mineralogy weathering state and joint
 pattern The distribution of these two units together with the presence of mafic dyke and fault are the major engineering
 geology features characterised the geology of study site It is believed that these features have played dominant roles in
 controlling the rock mass strength and groundwater condition It is therefore worth using the mapping data for planning and
 design of the subsequent engineering works In this project efforts have been made to demonstrate the value of combining dip
 measurement data in stereographic projection with other engineering geology information obtained from field mapping The
 limitations of using dip measurement alone for designing rock slope stabilization work is emphasized It was concluded that
 routine rock joint survey should be improved by understanding the site s geology in order to achieve better solution for

Computational Geosciences with Mathematica William Haneberg, 2012-12-06 Computational Geosciences with Mathematica is the only book written by a geologist specifically to show geologists and geoscientists how to use Mathematica to formulate and solve problems. It spans a broad range of geologic and mathematical topics which are drawn from the author's extensive experience in research consulting and teaching. The reference and text leads readers step by step through geologic applications such as custom graphics programming, data input and output, linear and differential equations, linear and nonlinear regression, Monte Carlo simulation, time series and image analysis, and the visualization and analysis of geologic surfaces. It is packed with actual Mathematica output and includes boxed Computer Notes with tips and exploration suggestions. **Engineering Geology Field Manual, Second Edition, Vol. 2, 2001, ***, 2002* *Directions for Engineering Geological Mapping on the Scale of 1:10,000: International Post Graduate Course on the Principles and Methods of Engineering Geology* Hungary.
