Yannas,2014-11-21 This textbook describes the basic principles of induced organ regeneration in skin and peripheral nerves and extends the original successful paradigm to other organs A set of trans organ rules is established and its use in regeneration of several organs is illustrated from the works of several independent investigators who worked with a variety of organs such as the lung the bladder and the Achilles tendon using collagen based scaffolds somewhat similar to the original one These critical medical treatments fill the clinical need that is not met by organ transplantation New to this second edition New information extending the paradigm of tissue regeneration from organ regeneration in skin and peripheral nerves to other organs Guidelines known as trans organ rules are described for the first time for extending this unique medical treatment to organs of several medical specialties The work serves as a comprehensive text and reference for students and practitioners of tissue engineering ***Tissue and Organ Regeneration in Adults*** Ioannis V. Yannas,2004 Using data and analyses obtained from the study of skin and peripheral nerves the author makes the case that what shows

promise with these two organs suggests a generic methodology for synthesis of other organs

Regeneration of Tissues and Organs Using Autologous Cells ,2012 The proposed work aims to address three major challenges to the field of regenerative medicine 1 the growth and expansion of regenerative cells outside the body in controlled in vitro environments 2 supportive vascular supply for large tissue engineered constructs and 3 interactive biomaterials that can orchestrate tissue development in vivo Toward this goal we have engaged a team of scientists with expertise in cell and molecular biology physiology biomaterials controlled release nanomaterials tissue engineering bioengineering and clinical medicine to address all three challenges This combination of resources combined with the vast infrastructure of the WFIRM have brought to bear on projects to discover and test new sources of autologous cells that can be used therapeutically novel methods to improve vascular support for engineered tissues in vivo and to develop intelligent biomaterials and bioreactor systems that interact favorably with stem and progenitor cells to drive tissue maturation The Institute s ongoing programs are aimed at developing regenerative medicine technologies that employ a patient s own cells to help restore or replace tissue and organ function This DOE program has

provided a means to solve some of the vexing problems that are germane to many tissue engineering applications regardless of tissue type or target disease By providing new methods that are the underpinning of tissue engineering this program facilitated advances that can be applied to conditions including heart disease diabetes renal failure nerve damage vascular disease and cancer to name a few These types of conditions affect millions of Americans at a cost of more than 400 billion annually Regenerative medicine holds the promise of harnessing the body s own power to heal itself By addressing the fundamental challenges of this field in a comprehensive and focused fashion this DOE program has opened new opportunities to treat conditions where other approaches have failed
