STRESS FIELDS FOR SIMPLE STRUCTURES 2 1 INTRODUCTION In this chapter the behavior and strength of simple structures made of reinforced or prestressed concrete is investigated with the aid of stress fields In particular the webs and flanges of beams simple walls brackets bracing beams and joints of frames are investigated By this means the majority of design cases are already covered In reality all structural components are three dimensional Here however components are considered either directly as two dimensional plate elements i e the plane stress condition with no variation of stress over the thickness of the element or they are subdivided into several plates Since two dimensional structural elements are statically redundant it is possible for a particular loading to be in equilibrium with many theoretically an infinite number of stress states If the lower bound method of the theory of plasticity is employed then an admissible stress field or any combination of such stress fields may be selected In chapter 4 it is shown that this method is suitable for the design of reinforced concrete structures and the consequence of the choice of the final structural system on the structural behavior is dealt with in detail The first cases of the use of this method date back to Ritter 6 and Morsch 4 who already at the beginning of the century investigated the resultants of the internal stresses by means of truss models

Most of the embodied energy can be saved in the load bearing structure Conceptual Design of Structures is working at the interface between structural engineering architecture and art The book seeks to answer the complex question of what needs to be considered when conceiving a building structure What influences the process of conceptual thinking How do space and structure interact In what ways do architects and engineers work together The book thus sheds light on the topic of multidisciplinary interrelationships in design showing numerous different perspectives Renowned practitioners and researchers from architecture and engineering share their insights as do artists and historians who cross the disciplinary boundaries Furthermore this book also provides an outlook on possible future developments and aspects of sustainable design and construction Bridging practice academic and research Holistic perspectives through contributors from different disciplines Numerous essays interviews and project reviews provide direct insights Selected works from engineering architecture and art

for Structural Concrete, 2018-08-01 *High Tech Concrete: Where Technology and Engineering Meet* D.A. Hordijk, M. Luković, 2017-06-08 This book contains the proceedings of the fib Symposium High Tech Concrete Where Technology and Engineering Meet that was held in Maastricht The Netherlands in June 2017 This annual symposium was organised by the Dutch Concrete Association and the Belgian Concrete Association Topics addressed include materials technology modelling testing and design special loadings safety reliability and codes existing concrete structures durability and life time sustainability innovative building concepts challenging projects and historic concrete amongst others The fib International Federation for Structural Concrete is a not for profit association committed to advancing the technical economic aesthetic and environmental performance of concrete structures worldwide Partial factor methods for existing concrete structures FIB - Féd. Int. du Béton, 2016 For a large part of the existing buildings and infrastructure the design life has been reached or will be reached in the near future These structures might need to be reassessed in order to investigate whether the safety requirements are met Current practice on the assessment of existing concrete structures however needs a thorough evaluation from a risk and reliability point of view as they are mostly verified using simplified procedures based on the partial factor method commonly applied in design of new structures Such assessments are often conservative and may lead to expensive upgrades Although the last decades reliability based assessment of existing concrete structures has gained wide attention in the research field a consistent reliability based assessment framework and a practically applicable codified approach which is compatible with the Eurocodes and accessible for common structural engineering problems in everyday practice is currently missing Such an approach however allows for a more uniform more objective and probably more widely applied assessment approach for existing concrete structures Hence in this bulletin two different partial factor formats are elaborated i.e. the Design Value Method DVM and the Adjusted Partial Factor Method APFM enabling the incorporation of specific reliability related aspects for existing structures The DVM proposes a fundamental basis for evaluating partial factors whereas the APFM provides adjustment factors to be applied on the partial factors for new structures in EN 1990 In this bulletin both methods are elaborated and evaluated and a basis is provided for decision making regarding the target safety level of existing structures **Shear and Punching Shear in RC and FRC Elements** fib Fédération internationale du béton, 2010-12-01 fib Bulletin 57 is a collection of contributions from a workshop on Recent developments on shear and punching shear in RC and FRC elements held in Sal Italy in October 2010 Shear is one of a few areas of research into fundamentals of the behaviour of concrete structures where contention remains amongst researchers There is a continuing debate between researchers from a structures perspective and those from a materials or fracture mechanics perspective about the mechanisms that enable the force flow through a concrete member and across cracks In 2009 a Working Group was formed within fib Task Group 4.2 Ultimate Limit State Models to harmonise different ideas about design procedures for shear and punching An important outcome of this work was the ensuing discussions between experts and practitioners

regarding the shear and punching provisions of the draft fib Model Code which led to the organization of the Sal workshop. Invited experts in the field of shear and FRC gave 18 lectures at the workshop that was attended by 72 participants from 12 countries in 3 different continents. The contributions from this conference as compiled in this bulletin are believed to represent the best of the current state of knowledge. They certainly are of general interest to fib members and especially helpful in the finalization of the 2010 fib Model Code. It is hoped that this publication will stimulate further research in the field to refine and harmonize the available analytical models and tools for shear and punching design.

Computational Modelling of Concrete Structures Günther Meschke, Bernhard Pichler, Jan G. Rots, 2018-01-31. The EURO C conference series Split 1984, Zell am See 1990, Innsbruck 1994, Badgastein 1998, St. Johann im Pongau 2003, Mayrhofen 2006, Schladming 2010, St. Anton am Arlberg 2014, and Bad Hofgastein 2018 brings together researchers and practising engineers concerned with theoretical, algorithmic and validation aspects associated with computational simulations of concrete and concrete structures. *Computational Modelling of Concrete Structures* reviews and discusses research advancements and the applicability and robustness of methods and models for reliable analysis of complex concrete reinforced concrete and pre-stressed concrete structures in engineering practice. The contributions cover both computational mechanics and computational modelling aspects of the analysis and design of concrete and concrete structures. Multi-scale cement and concrete research experiments and modelling, Aging concrete from very early ages to decades long durability, Advances in material modelling of plain concrete, Analysis of reinforced concrete structures, Steel-concrete interaction, fibre reinforced concrete and masonry, Dynamic behaviour from seismic retrofit to impact simulation. *Computational Modelling of Concrete Structures* is of special interest to academics and researchers in computational concrete mechanics as well as industry experts in complex nonlinear simulations of concrete structures.

Geometrical Characterisation for Structural Robustness Aurélie

Deschuyteneer, 2019-11-20. This thesis develops a new type of approach to structural robustness working on geometrical considerations only. It allows the integration of constitutive dimensions of structural robustness at the earliest steps of the design process. Based on graphic statics and strut and tie modelling, the method develops a visual robustness indicator.
