**Life with a Battery-Operated Brain** Jackie Hunt Christensen, 2009-04 Why would anyone say Let's stick wires into someone's brain, run voltage through it and see what happens? So asks Jackie Hunt Christensen in *Life With a Battery Operated Brain: A Patient's Guide to Deep Brain Stimulation Surgery for Parkinson's Disease*. Author Christensen answers this question and more in her unique and comprehensive book as she has first-hand knowledge of the procedure commonly referred to as DBS. She herself lived with Parkinson's disease for more than seven years before electing to be evaluated for DBS surgery. It was not a fast and easy choice. For Christensen, a fear of DBS surgery, which involves placing one or two electrical wires inside the brain and its potential complications, had to be weighed against quality of life without the surgery: a life of increasing parkinsonian symptoms and a growing pharmacopeia of medications which might help control her symptoms but which could have devastating long-term effects on her body. Ultimately, she was deemed a good candidate for the surgery and DBS seemed like her only logical option, a choice that has been validated post-surgery as Christensen now enjoys life with most of her motor symptoms well controlled.

Neurobiology of Interval Timing Hugo Merchant, Victor de Lafuente, 2024-06-25 The study of how the brain processes time is becoming one of the most important topics in systems cellular computational and cognitive neuroscience as well as in the physiologic bases of music and language During the last

and current decade interval timing has been intensively studied in humans and animals using increasingly sophisticated approaches This new edition of the Neurobiology of Interval Timing integrates the current knowledge of animal behavior and human cognition of the passage of time in different behavioral contexts including the perception and production of time intervals as well as rhythmic activities The chapters are written by the leading experts in the fields of psychophysics functional imaging systems neurophysiology and musicology The new edition features a complete updating of the content with many new chapters The main updates are the remarkable advances in our understanding of the neural basis of temporal processing in monkeys rodents and humans The notion is that the neural clock depends on the dynamics of neural populations in the motor system and that this general internal time representation interacts with the sensory and cognitive systems depending on the timing requirements and the behavioral contingencies of a specific task Also this edition delineates a clearer distinction between interval based and beat based timing in humans
