Gibbins,Martyn P. Mahaut-Smith,2008-02-04 12 The average

human body has in the order of 10 circulating platelets They are crucial for hemostasis and yet excessive platelet activation is a major cause of morbidity and mortality in western societies It is therefore not surprising that platelets have become one of the most extensively investigated biological cell types We are however far from understanding precisely how platelets become activated under physiological and pathophysiological conditions In addition there are large gaps in our knowledge of platelet production from their giant precursor cell the megakaryocyte Understanding megakaryocyte biology will be crucial for the development of platelet gene targeting The aim of Platelets and Megakaryocytes is therefore to bring together established and recently developed techniques to provide a comprehensive guide to the study of both the platelet and the megakaryocyte It consists of five sections split between two volumes The more functional assays appear in Volume 1 whereas Volume 2 includes signaling techniques postgenomic methods and a number of key perspectives chapters Part I of Volume 1 Platelets and Megakaryocytes Functional Assays describes many well established approaches to the study of platelet function including aggregometry secretion arachidonic acid metabolism procoagulant responses platelet adhesion under static or flow conditions flow cytometry and production of microparticles Although one would ideally wish to perform experiments with human platelets studies within the circulation using intravital microscopy require the use of animal models which are described in Chapter 16 vol 1
