Climate Change Biology:

Climate Change Biology, 2011 Climate change has moved from being a contested phenomenon to the top of the agenda at global summits Climate Change Biology is the first major textbook to address the critical issue of how climate change may affect life on the planet and particularly its impact on human populations Presented in four parts the first deals extensively with the physical evidence of climate change and various modelling efforts to predict its future Biological responses are addressed in the second part from the individual s physiology to populations and ecosystems and further to considering adaptation and evolution The third part examines the specific impact climate change may have on natural resources agriculture and forestry The final part considers research on the cutting edge of impact prediction and the practical and philosophical limitations on our abilities to predict these impacts This text will be a useful asset to the growing number of both undergraduate and graduate courses on impacts of climate change as well as providing a succinct overview for researchers new to the field

Climate Change Biology Lee Hannah, 2014-11-17 Climate Change Biology 2e examines the evolving discipline of human induced climate change and the resulting shifts in the distributions of species and the timing of biological events The text focuses on understanding the impacts of human induced climate change by drawing on multiple lines of evidence including paleoecology modeling and current observation This revised and updated second edition emphasizes impacts of human adaptation to climate change on nature and greater emphasis on natural processes and cycles and specific elements With four new chapters an increased emphasis on tools for critical thinking and a new glossary and acronym appendix Climate Change Biology 2e is the ideal overview of this field Expanded treatment of processes and cycles Additional exercises and elements to encourage independent and critical thinking Increased on line supplements including mapping activities and suggested labs and classroom activities

Climate Change and Biodiversity Thomas E. Lovejoy, Lee Hannah, 2004-12-01 Leading researchers discuss what is now known about the effects of climate change on the natural world They examine recent trends in and projections about climate change ways that particular organisms are responding to climate change conservation challenges including social and policy issues and more This book will be a milestone in the emerging discipline of climate change biology No issue is more important for the global environment the impressive line up of experts here gives it definitive coverage Edward O Wilson Harvard University A well written treatise on the past present and future effects of climate change on plant and animal biodiversity It is destined to become a classic Choice

Biodiversity and Climate Change Thomas E. Lovejoy, Lee Jay Hannah, 2019-01-01 An essential up to date look at the critical interactions between biological diversity and climate change that will serve as an immediate call to action The physical and biological impacts of climate change are dramatic and broad ranging People who care about the planet and manage natural resources urgently need a synthesis of our rapidly growing understanding of these issues In this all new sequel to the 2005 volume Climate Change and Biodiversity leading experts in the field summarize observed changes assess what the future holds and

Global Climate Change and Terrestrial Invertebrates Scott N. Johnson,T. Hefin Jones,2025-05-19 Invertebrates perform such vital roles in global ecosystems and so strongly influence human wellbeing that biologist E O Wilson was prompted to describe them as little things that run the world As they are such powerful shapers of the world around us their response to global climate change is also pivotal in meeting myriad challenges looming on the horizon everything from food security and biodiversity to human disease control This book presents a comprehensive overview of the latest scientific knowledge and contemporary theory relating to global climate change and terrestrial invertebrates Featuring contributions from top international experts this book explores how changes to invertebrate populations will affect human decision making processes across a number of crucial issues including agriculture disease control conservation planning and resource allocation Topics covered include methodologies and approaches to predict invertebrate responses outcomes for disease vectors and ecosystem service providers underlying mechanisms for community level responses to global climate change evolutionary consequences and likely effects on interactions among organisms and many more Timely and thought provoking *Global Climate Change and Terrestrial Invertebrates* offers illuminating insights into the profound influence the simplest of organisms may have on the very future of our fragile world

Climate Change, Ecology and Systematics Trevor R. Hodgkinson,Michael B. Jones,Stephen Waldren,John A. N. Parnell,2011-04-28 Climate change has shaped life in the past and will continue to do so in the future Understanding the interactions between climate and biodiversity is a complex challenge to science With contributions from 60 key researchers this book examines the ongoing impact of climate change on the ecology and diversity of life on earth It discusses the latest research within the fields of ecology and systematics highlighting the increasing integration of their approaches and methods Topics covered include the influence of climate change on evolutionary and ecological processes such as adaptation migration speciation and extinction and the role of these processes in determining the diversity and biogeographic distribution of species and their populations This book ultimately illustrates the necessity for global conservation actions to mitigate the effects of climate change in a world that is already undergoing a biodiversity crisis of unprecedented scale
