Abstract: The aim of this study is to focus on a disease with a potential global health risk—VL (visceral leishmaniasis) or kala-azar. By understanding the mechanisms of occurrence, development and coexisting infections, we can expect significant improvement in the indicators of morbidity and mortality. The specific method of transmission, as well as the necessary conditions for it, opens wide opportunities for prevention. The biophysical aspects that we present make it possible to assess the seriousness of the advancing physiological changes. This ensures adequate evaluation of the associated risks and search for an optimal therapy. We have found that from the first manifestations of kala-azar up until today, a series of countermeasures have been taken up. Acknowledging and expecting the manifoldness of the infectious process, it is possible for it to cover areas whose population is unprepared to handle the contamination optimally. This requires the continuation of studies aimed at finding the most affordable and biologically tolerable medicine. The available treatment option for visceral leishmaniasis is problematic when it comes to efficacy, adverse effects and cost, making the treatment a complex issue. Not to mention toxicity of the drugs, ability to monitor side effects, length of treatment and capacity of the healthcare service to administer accurate therapy. The main drugs available for treatment of VL (visceral leishmaniasis) are systemic agents like Antimony, Amphotericin and nowadays the oral drug Miltefosine.

Key words: Kala-azar, transmission, biophysical aspects, biologically tolerable medicine, therapy.

1. Introduction

Leishmaniasis is a protozoan transmitted disease. It is caused by blood flagellates that parasitize in the organs of the reticuloendothelial system and the skin, respectively visceral and cutaneous leishmaniasis. Visceral leishmaniasis is also known as kala-azar (from Hindi “black fever”) due to the specific skin hyperpigmentation discovered in patients from the Hindustan Peninsula, India [1]. The problem with global warming is that it leads to increased spread of many infectious diseases, which means that some, if not most countries would be unprepared to face the consequences of an outbreak in an unusual place. Therefore, we believe that a correct understanding of the mechanism of transmission and treatment of kala-azar predisposes an expanding scientific interest

in this disease and finding new universal methods of prevention and therapy.

Leishmaniasis is the second largest parasitic killer in the world (after malaria), responsible for an estimated 200,000 to 400,000 infections each year worldwide [2].

Kala-azar is an example for harmful positive feedback—an interaction between the managing body (immune system) and the object of management (bone marrow) in a biological cybernetic system. The parasite, due to its characteristics, is not degraded by enzymes in the phagocytic cell, but instead lives on, dividing mitotically.

Parasites enter the bloodstream and migrate to the internal organs, such as the liver, spleen and bone marrow and, if left untreated, almost always results in the death of the host. The most common symptoms are: fever, weight loss, fatigue, anemia, substantial swelling of the spleen and liver, skin lesions.
