

5. Working Principle

Bring specified DC voltage to bear on two stainless steel concentric electrodes immersed in oil use micro-current amplifier to detect the current flowing past oil material and get its conductivity.

Below is the basic formula:

$$K=QG - (1)$$

$$=QU/I - (2)$$

$$=Q/RK - (3)$$

K - Oil Conductivity (pS/M)

U - Applied Voltage of Electrode (V)

I - Current flowing past oil sample(pA)

Q - Cell constant conductivity measuring electrodes (This meter Q=1/m)

R - Resistance of oil between electrode (T Ω)

G - Conductivity of oil between electrode(pS)

6. Operations

6.1 Routine Inspection

When you need to keep measuring the reading at the 3rd to second automatically, kindly open the back and turn KO to ON.

1) Put In Battery

One new battery can afford thousands of tests, and it should be changed before the self-checking readings is low 10 digital. Open the back with Phillips screwdriver, then you can change it. This model of this layer-built battery is 6F22.9V.

2) Zero Check

Without probe, the digital reading of this meter is 0000E2 while pressing "M" button. When environmental humiture is high, several digital will be deviated at Zero. For the convenience of reading, you can use horologic driver to calibrate by adjusting "0" potentiometer in the meter.

3) Self-Verification

When pressing "M" and "T" simultaneously, the reading is "4.00" If reading is below 3.90, probably the battery is run down, just open the back to change new battery. If the reading deviation is above 10 digital when battery is normal (it means the system error increases 2.5% above). It needs to be re-calibrated.
