Processing Noise Vyacheslav Tuzlukov, 2018-10-08 Additive and multiplicative noise in the information signal can significantly limit the potential of complex signal processing systems especially when those systems use signals with complex phase structure During the last few years this problem has been the focus of much research and its solution could lead to profound improvements in applications of complex signals and coherent signal processing Signal Processing Noise sets forth a generalized approach to signal processing in multiplicative and additive noise that represents a remarkable advance in signal processing and detection theory This approach extends the boundaries of the noise immunity set by classical and modern signal processing theories and systems constructed on this basis achieve better detection performance than that of systems currently in use Featuring the results of the author's own research the book is filled with examples and applications and each chapter contains an analysis of recent observations obtained by computer modelling and experiments Tables and illustrations clearly show the superiority of the generalized approach over both classical and modern approaches to signal processing noise Addressing a fundamental problem in complex signal processing systems this book offers not only theoretical development but practical recommendations for raising noise immunity in a wide range of applications

Sudip Misra, Isaac Woungang, Subhas Chandra Misra, 2009-05-29 Overview and Goals Wireless communication technologies are undergoing rapid advancements The last few years have experienced a steep growth in research in the area of wireless sensor networks WSNs In WSNs communication takes place with the help of spatially distributed autonomous sensor nodes equipped to sense specific information WSNs especially the ones that have gained much popularity in the recent years are typically ad hoc in nature and they inherit many characteristics features of wireless ad hoc networks such as the ability for infrastructure less setup minimal or no reliance on network planning and the ability of the nodes to self organize and self configure without the involvement of a centralized network manager router access point or a switch These features help to set up WSNs fast in situations where there is no existing network setup or in times when setting up a fixed infrastructure network is considered infeasible for example in times of emergency or during relief operations WSNs find a variety of applications in both the military and the civilian population worldwide such as in cases of enemy intrusion in the battlefield object tracking habitat monitoring patient monitoring fire detection and so on Even though sensor networks have emerged to be attractive and they hold great promises for our future there are several challenges that need to be addressed Some of the well known challenges are attributed to issues relating to coverage and deployment scalability quality of service size computational power energy efficiency and security **Fundamentals of Statistical Signal**
