Davis Jr., Robert W. Dalrymple, 2011-10-20 This book presents a comprehensive contemporary review of tidal environments and deposits Individual chapters each written by world class experts cover the full spectrum of coastal shallow marine and even deep marine settings where tidal action influences or controls sediment movement and deposition Both siliciclastic and carbonate deposits are covered Various chapters examine the dynamics of sediment transport by tides and the morphodynamics of tidal systems Several chapters explore the occurrence of tidal deposits in the stratigraphic context of entire sedimentary basins This book is essential reading for both coastal geologists and managers and geologists interested in extracting hydrocarbons from complex tidal successions **The Bahía Blanca Estuary** Sandra M. Fiori, Paula D. Pratolongo, 2021-08-03 The Bah a Blanca Estuary is one of the largest coastal systems in Atlantic South America This mesotidal estuary situated in a sharp transition between humid subtropical and semiarid climates has a unique combination of large interannual climatic variations The estuarine area encompasses roughly 2300 square kilometers and is composed of wide expanses of intertidal flats salt marshes and emerged islands which create intricate landscape patterns Natural environments in the estuary sustain a high concentration of marine and terrestrial species including endemic threatened and endangered fish and shorebirds Puerto Cuatrerros in the inner zone of the estuary hosts a permanent marine research station whose records span more than 30 years of biophysical variables and represent one of the largest time series of ecological data in South America Beyond its ecological relevance the Bah a Blanca Estuary is under increasing anthropogenic pressure from large urban settlements industrial developments and harbors raising the question of how to balance conservation and development The Bah a Blanca Estuary Ecology and Biodiversity offers a comprehensive review of life in the ecosystems of the estuary The book is divided into five major sections the first of which provides a description of the regional setting and covers key aspects of estuarine dynamics The three following sections are dedicated to different habitat types and within each section the chapters are organized around major functional groups from pelagic and benthic environments The fifth and final section covers issues

Shore Processes and their Palaeoenvironmental Applications Edward J. Anthony, 2008-11-21 The last five years have been marked by rapid technological and analytical developments in the study of shore processes and in the comprehension of shore deposits and forms and shoreline change over time These developments have generated a considerable body of literature in a wide range of professional journals thus illustrating the cross disciplinary nature of shore processes and the palaeo environmental dimension of shore change The justification of the book lies in bringing together these developments using an objective approach that synthesises current advances technical progress in the analysis of shores and shore processes contradictory interpretations and potential advances using future generation developments in techniques The book provides a

comprehensive state of the art presentation of shore processes and deposits across ranges of wave energy and tide range environments sediment supply and textural conditions sea level change exceptional events and longer term climate change based on the most recently published literature in the marine sciences The book insists on the nested time and spatial scales through which are inter linked shore processes and deposits thus providing a better understanding of the way shores change over time The approach is thus cross disciplinary and gap bridging between processes and deposits between analytical techniques and between timescales The audience is from graduate level upwards and the book is intended as a comprehensive reference source for professionals in a wide range of coastal science fields geologists sedimentologists geomorphologists oceanographers engineers managers archaeologists Aimed at graduates and specialists interested in coastal science Presents background research recent developments and future trends Written by a leading scholar and industry expert
