Through-the-Wall Radar Imaging Moeness G. Amin, 2017-12-19. Through the wall radar imaging TWRI allows police fire and rescue personnel first responders and defense forces to detect identify classify and track the whereabouts of humans and moving objects. Electromagnetic waves are considered the most effective at achieving this objective yet advances in this multi faceted and multi disciplinary technology require taking phenomenological issues into consideration and must be based on a solid understanding of the intricacies of EM wave interactions with interior and exterior objects and structures. Providing a broad overview of the myriad factors involved namely size weight mobility acquisition time aperture distribution power bandwidth standoff distance and most importantly reliable performance and delivery of accurate information. Through the Wall Radar Imaging examines this technology from the algorithmic modeling experimentation and system design perspectives. It begins with coverage of the electromagnetic properties of walls and building materials and discusses techniques in the design of antenna elements and array configurations beamforming concepts and issues and the use of antenna array with collocated and distributed apertures. Detailed chapters discuss several suitable waveforms inverse scattering approaches and revolve around the relevance of physical based model approaches in TWRI along with theoretical and experimental research in 3D building tomography using microwave remote sensing high frequency asymptotic modeling methods synthetic aperture radar SAR techniques impulse radars airborne radar imaging of multi floor buildings strategies for target detection and detection of concealed targets. The book concludes with a discussion of how the Doppler principle can be used to measure motion at a very fine level of detail. The breadth and depth of topics covered presents a highly detailed treatment of this potentially life

saving technology Advances in Sensing with Security Applications Jim Byrnes, 2006-01-02 The chapters in this volume were presented at the July 2005 NATO Advanced Study Institute on Advances in Sensing with Security Applications. The conference was held at the beautiful Il Ciocco resort near Lucca in the glorious Tuscany region of northern Italy. Once again we gathered at this idyllic spot to explore and extend the reciprocity between mathematics and engineering. The dynamic interaction between world renowned scientists from the usually disparate communities of pure mathematicians and applied scientists which occurred at our six previous ASI's continued at this meeting. The fusion of basic ideas in mathematics, biology and chemistry with ongoing improvements in hardware and computation offers the promise of much more sophisticated and accurate sensing capabilities than currently exist. Coupled with the dramatic rise in the need for surveillance in innumerable aspects of our daily lives brought about by hostile acts deemed unimaginable only a few short years ago, the time was right for scientists in the diverse areas of sensing and security to join together in a concerted effort to combat the new brands of terrorism. This ASI was one important initial step. To encompass the diverse nature of the subject and the varied backgrounds of the anticipated participants, the ASI was divided into three broadly defined but interrelated areas: the increasing need for fast and accurate sensing; the scientific underpinnings of the ongoing revolution in sensing; and specific sensing algorithms and techniques. The ASI brought together world leaders from academia, government and industry with extensive multidisciplinary background evidenced by their research and participation in numerous workshops and conferences.
