**Lysophospholipid Receptors** Jerold Chun, 2013-02-06

The current state of the science supporting new research in lysophospholipids. The study of lysophospholipids exploded with the discovery of cell surface receptors on both lysophosphatidic acid (LPA) and sphingosine 1 phosphate (S1P). Since then thousands of original research reports ranging from fundamental cell signaling to the physiology and pathophysiology of individual organ systems have centered on lysophospholipids. This book draws together and analyzes the current literature to provide readers with a state of the science review as well as current techniques that support research in all aspects of the field of lysophospholipid signaling. Lysophospholipid Receptors is divided into three sections: Receptors and other possible effectors, Enzymes, Physiology and pathophysiology. Within each section the authors explain the similarities and differences between LPA and S1P signaling. Examples are provided that demonstrate the underlying mechanisms of lysophospholipid signaling across a broad range of organ systems such as S1P signaling in cardiovascular physiology and disease and the neural effects of LPA signaling. Extensive references at the end of each chapter provide a gateway to the literature and facilitate further research into individual topics. Each chapter has been authored by one or more leading international authorities in lysophospholipid research. Based on a thorough analysis of the current research, the authors set forth what is established science and offer their expert opinion and perspective on new and emerging areas of research, setting the stage for further investigations that will solve current problems in the field.

**Embryo Cleavage** Bin Wu, 2017-09-06

Embryo cleavage experiences a series of critical events and remarkable epigenetic modifications, especially morphological change and gene expression. The development of current assisted reproductive technology has created some new observations and novel discoveries in cleavage embryos. This book updates some new technologies and methods on the study of cleavage embryos to select high quality embryos for transfer and improve embryo implantation and pregnancy. Major contents include embryo cleavage morphokinetics based on time lapse imaging, gene expression of cleavage embryo and noninvasive assessment and improving embryo cleavage technology. Thus, this book will greatly add new information for embryologists to select good quality embryos for transfer to improve human embryo transfer pregnancy rate.

*Recurrent Pregnancy Loss and Endocrine Dysfunction* Hong Zhang, Hongbin Chi, Federico Jensen, Lianghai Diao, Zitao Liu, 2024-07-17

Recurrent pregnancy loss (RPL), defined by WHO as three or more consecutive pregnancy losses, bothers 1-5% of couples around the world significantly.

impacting their partnership and quality of life. However, the causes for the occurrence of RPL are complicated and mysterious. Over the years, many factors have been described, studied, and criticized, including structural uterine abnormalities, genetic diseases, autoimmune disorders, endocrine dysfunction, and so on. Among these endocrine factors, especially thyroid dysfunction, PCOS, insulin resistance, and hyperprolactinemia, accounts for an important part and can be easily screened and identified with simple tests. Nevertheless, there are still many gaps in the exact mechanisms underlying the pathogenesis of endocrine-related PRL, as well as the strategy and value of treatment for these endocrine dysfunctions. This Research Topic aims to present new findings on the pathogenesis of endocrine-related PRL. We hope to better understand how endocrine dysfunction leads to PRL and then find potential therapeutic targets. It also aims to present new evidence on the treatment for endocrine-related PRL, providing guidance for clinical strategies.

Climate Change and Its Impact on Fertility Wani, Khursheed Ahmad, Naha, Nibedita, 2021-01-22 Climate change is the biggest threat to the fertility of mammals across the globe through its potential effects on heat stress, nutrition, security, extreme weather events, vulnerable shelter, and population migration. Climatic variables such as temperature and humidity are common environmental stressors, as well as nutritional stress, which reduces fertility. Besides climate and nutritional stressors, another major factor responsible for reduced fertility discovered within the past decade is the exposure to potential hazardous substances such as chemical, radiation, physical, biological, and occupational hazards. This exposure includes anything from heavy metals and gases to pathogens and toxins and any substance that interferes with natural biological functions of the exposed workers, pregnant and breast-feeding workers, and young working population. There also must be research focused on developmental hazards that alter the structure and function of the developing embryo, as well. The different climatic factors in the era of climate change need to be explored to discuss the impacts on fertility. Climate Change and Its Impact on Fertility highlights the issues and concerns that address the latest impact of climate change and mitigation strategies for enhancing early embryo survival and uterine potential. This book covers the effects of climate change on both the biological parents and the embryo by discussing the negative impacts, providing an overview of the variety of climate changes currently affecting fertility, and exploring possible solutions. This book is ideally intended for medical scientists and doctors, reproductive biologists, experimental toxicologists, mammalian cell biologists, clinicians, embryologists, health and safety agencies, regulatory authorities, public health officials, and policymakers, along with practitioners, stakeholders, researchers, academicians, and students interested in climate change and its link to embryo growth, developmental risk, implantation failure, and fertility.
