Geometry and Arithmetic Around Euler Partial Differential Equations R.-P. Holzapfel, 1986-08-31 [Introduction to Geometry of Manifolds with Symmetry](#) V.V. Trofimov, 2013-04-17 One of the most important features of the development of physical and mathematical sciences in the beginning of the 20th century was the demolition of prevailing views of the three dimensional Euclidean space as the only possible mathematical description of real physical space. Apriorization of geometrical notions and identification of physical 3 space with its mathematical model were characteristic for these views. The discovery of non Euclidean geometries led mathematicians to the understanding that Euclidean geometry is nothing more than one of many logically admissible geometrical systems. Relativity theory amended our understanding of the problem of space by amalgamating space and time into an integral four dimensional manifold. One of the most important problems lying at the crossroad of natural sciences and philosophy is the problem of the structure of the world as a whole. There are a lot of possibilities for the topology of four dimensional space time and at first sight a lot of possibilities arise in cosmology. In principle not only can the global topology of the universe be complicated but also smaller scale topological structures can be very nontrivial. One can imagine two usual spaces connected with a throat making the topology of the union complicated.

Geometry of Lie Groups B. Rosenfeld, Bill Wiebe, 2013-03-09 This book is the result of many years of research in Non Euclidean Geometries and Geometry of Lie groups as well as teaching at Moscow State University 1947-1949, Azerbaijan State University Baku 1950-1955, Kolomna Pedagogical College 1955-1970, Moscow Pedagogical University 1971-1990 and Pennsylvania State University 1990-1995. My first books on Non Euclidean Geometries and Geometry of Lie groups were written in Russian and published in Moscow: Non Euclidean Geometries 1955, Ro1, Multidimensional Spaces 1966, Ro2, and Non Euclidean Spaces 1969, Ro3. In Ro1 I considered non Euclidean geometries in the broad sense as geometry of simple Lie groups since classical non Euclidean geometries hyperbolic and elliptic are geometries of simple Lie groups of classes B_n and D and geometries of complex n and quaternionic Hermitian elliptic and hyperbolic spaces are geometries of simple Lie groups of classes A_n and E_n . Ro1 contains an exposition of the geometry of classical real non Euclidean spaces and their interpretations as hyperspheres with identified antipodal points in Euclidean or pseudo Euclidean spaces and in projective and conformal spaces. Numerous interpretations of various spaces different from our usual space allow us like stereoscopic vision to see many traits of these spaces absent in the usual space. *Hamiltonian Mechanical Systems and Geometric Quantization* Mircea Puta, 2012-12-06 This volume presents various aspects of the geometry of symplectic and Poisson manifolds and applications in Hamiltonian mechanics and geometric quantization are indicated. Chapter 1 presents some general facts about symplectic vector space, symplectic manifolds and symplectic reduction. Chapter 2 deals with the study of Hamiltonian mechanics. Chapter 3 considers some standard facts concerning Lie groups and algebras which lead to the theory of momentum mappings and the Marsden-Weinstein reduction. Chapters 4 and 5 consider the theory and the stability

of equilibrium solutions of Hamilton Poisson mechanical systems Chapters 6 and 7 are devoted to the theory of geometric quantization This leads in Chapter 8 to topics such as foliated cohomology the theory of the Dolbeault Kostant complex and their applications A discussion of the relation between geometric quantization and the Marsden Weinstein reduction is presented in Chapter 9 The final chapter considers extending the theory of geometric quantization to Poisson manifolds via the theory of symplectic groupoids Each chapter concludes with problems and solutions many of which present significant applications and in some cases major theorems For graduate students and researchers whose interests and work involve symplectic geometry and Hamiltonian mechanics

Lightlike Submanifolds of Semi-Riemannian Manifolds and Applications

Krishan L. Duggal, Aurel Bejancu, 2013-04-17 This book is about the light like degenerate geometry of submanifolds needed to fill a gap in the general theory of submanifolds The growing importance of light like hypersurfaces in mathematical physics in particular their extensive use in relativity and very limited information available on the general theory of lightlike submanifolds motivated the present authors in 1990 to do collaborative research on the subject matter of this book Based on a series of author s papers Bejancu 3 Bejancu Duggal 1 3 Dug gal 13 Duggal Bejancu 1 2 3 and several other researchers this volume was conceived and developed during the Fall 91 and Fall 94 visits of Bejancu to the University of Windsor Canada The primary difference between the lightlike submanifold and that of its non degenerate counterpart arises due to the fact that in the first case the normal vector bundle intersects with the tangent bundle of the submanifold Thus one fails to use in the usual way the theory of non degenerate submanifolds of Chen 1 to define the induced geometric objects such as linear connection second fundamental form Gauss and Weingarten equations on the light like submanifold Some work is known on null hypersurfaces and degenerate submanifolds see an up to date list of references on pages 138 and 140 respectively Our approach in this book has the following outstanding features a It is the first ever attempt of an up to date information on null curves lightlike hypersur faces and submanifolds consistent with the theory of non degenerate submanifolds

Differentiable and Complex Dynamics of Several Variables

Pei-Chu Hu, Chung-Chun Yang, 2013-04-17 The development of dynamics theory began with the work of Isaac Newton In his theory the most basic law of classical mechanics is $f = ma$ which describes the motion n in \mathbb{R}^n of a point of mass m under the action of a force f by giving the acceleration a If n the position of the point is taken to be a point $x \in \mathbb{R}^n$ and if the force f is supposed to be a function of x only Newton s Law is a description in terms of a second order ordinary differential equation $J^2x = m \frac{d^2x}{dt^2} = f(x)$ It makes sense to reduce the equations to first order by defining the velocity as an extra n independent variable by $v \in \mathbb{R}^{2n}$ Then $x, v \in \mathbb{R}^{2n}$ Euler J L Lagrange and others studied mechanics by means of an analytical method called analytical dynamics Whenever the force f is represented by a gradient vector field $f = -\nabla U$ of the potential energy U and denotes the difference of the kinetic energy and the potential energy by $1/2 L(x, v) = 1/2 m v \cdot v - U(x)$ the Newton equation of motion is reduced to

the Euler Lagrange equation are used as the variables the Euler Lagrange equation can be If the momenta y written as $8L y$
 8x Further W R Smooth Quasigroups and Loops L. Sabinin, 2012-12-06 During the last twenty five years quite remarkable relations between nonassociative algebra and differential geometry have been discovered in our work Such exotic structures of algebra as quasigroups and loops were obtained from purely geometric structures such as affinely connected spaces The notion of module was introduced as a fundamental algebraic invariant of differential geometry For any space with an affine connection loopuscular modular and geomodular structures partial smooth algebras of a special kind were introduced and studied As it happened the natural geomodular structure of an affinely connected space allows us to reconstruct this space in a unique way Moreover any smoothly ab strictly given geomodular structure generates in a unique manner an affinely connected space with the natural geomodular structure isomorphic to the initial one The above said means that any affinely connected in particular Riemannian space can be treated as a purely algebraic structure equipped with smoothness Numerous habitual geometric properties may be expressed in the language of geomodular structures by means of algebraic identities etc Our treatment has led us to the purely algebraic concept of affinely connected in particular Riemannian spaces for example one can consider a discrete or even finite space with affine connection in the form of geomodular structure which can be used in the old problem of discrete space time in relativity essential for the quantum space time theory

Symmetries of Spacetimes and Riemannian Manifolds Krishan L. Duggal, Ramesh Sharma, 2013-11-22 This book provides an upto date information on metric connection and curvature symmetries used in geometry and physics More specifically we present the characterizations and classifications of Riemannian and Lorentzian manifolds in particular the spacetimes of general relativity admitting metric i.e Killing holothetic and conformal connection i.e affine conformal and projective and curvature symmetries Our approach in this book has the following outstanding features a It is the first ever attempt of a comprehensive collection of the works of a very large number of researchers on all the above mentioned symmetries b We have aimed at bringing together the researchers interested in differential geometry and the mathematical physics of general relativity by giving an invariant as well as the index form of the main formulas and results c Attempt has been made to support several main mathematical results by citing physical examples as applied to general relativity d Overall the presentation is self contained fairly accessible and in some special cases supported by an extensive list of cited references e The material covered should stimulate future research on symmetries Chapters 1 and 2 contain most of the prerequisites for reading the rest of the book We present the language of semi Euclidean spaces manifolds their tensor calculus geometry of null curves non degenerate and degenerate light like hypersurfaces All this is described in invariant as well as the index form Topological Fixed Point Theory of Multivalued Mappings Lech Górniewicz, 1999 This volume presents a broad introduction to the topological fixed point theory of multivalued set valued mappings treating both classical concepts as well as modern techniques A variety of up to date results is described within a unified framework *The*

Structure of Classical Diffeomorphism Groups Augustin Banyaga, 2013-03-14 In the 60 s the work of Anderson Chernavski Kirby and Edwards showed that the group of homeomorphisms of a smooth manifold which are isotopic to the identity is a simple group This led Smale to conjecture that the group $\text{Diff } M$ of C^r diffeomorphisms $r \geq 1$ of a smooth manifold M with compact supports and isotopic to the identity through compactly supported isotopies is a simple group as well In this monograph we give a fairly detailed proof that $\text{Diff } M$ is a simple group This theorem was proved by Herman in the case M is the torus \mathbb{T}^n in 1971 as a consequence of the Nash Moser Sergeraert implicit function theorem Thurston showed in 1974 how Herman's result on \mathbb{T}^n implies the general theorem for any smooth manifold M The key idea was to view an isotopy in $\text{Diff } M$ as a foliation on $M \times [0, 1]$ In fact he discovered a deep connection between the local homology of the group of diffeomorphisms and the homology of the Haefliger classifying space for foliations Thurston's paper 180 contains just a brief sketch of the proof The details have been worked out by Mather 120 124 125 and the author 12 This circle of ideas that we call the Thurston tricks is discussed in chapter 2 It explains how in certain groups of diffeomorphisms perfectness leads to simplicity In connection with these ideas we discuss Epstein's theory 52 which we apply to contact diffeomorphisms in chapter 6

Continuous Selections of Multivalued Mappings D. Repovš, P.V. Semenov, 2013-04-17 This book is dedicated to the theory of continuous selections of multi valued mappings a classical area of mathematics as far as the formulation of its fundamental problems and methods of solutions are concerned as well as J_n area which has been intensively developing in recent decades and has found various applications in general topology theory of absolute retracts and infinite dimensional manifolds geometric topology fixed point theory functional and convex analysis game theory mathematical economics and other branches of modern mathematics The fundamental results in this theory were laid down in the mid 1950 s by E Michael The book consists of relatively independent three parts Part A Theory Part B Results and Part C Applications We shall refer to these parts simply by their names The target audience for the first part are students of mathematics in their senior year or in their first year of graduate school who wish to get familiar with the foundations of this theory The goal of the second part is to give a comprehensive survey of the existing results on continuous selections of multivalued mappings It is intended for specialists in this area as well as for those who have mastered the material of the first part of the book In the third part we present important examples of applications of continuous selections We have chosen examples which are sufficiently interesting and have played in some sense key role in the corresponding areas of mathematics

Algorithmic and Computer Methods for Three-Manifolds A.T. Fomenko, S.V. Matveev, 2013-03-09 One service mathematics has rendered the human race It has put common sense back where it belongs It has put common sense back where it belongs on the topmost shelf next to the dusty canister labelled discarded nonsense Eric T Bell Every picture tells a story Advertisement for Sloan's backache and kidney oils 1907 The book you have in your hands as you are reading this is a text on 3 dimensional topology It can serve as a pretty comprehensive text book on the subject On the other hand it frequently gets to

the frontiers of current research in the topic If pressed I would initially classify it as a monograph but thanks to the over three hundred illustrations of the geometrical ideas involved as a rather accessible one and hence suitable for advanced classes The style is somewhat informal more or less like orally presented lectures and the illustrations more than make up for all the visual aids and handwaving one has at one's command during an actual presentation

Complete Minimal Surfaces of Finite Total Curvature Kichoon Yang, 2013-03-09 This monograph contains an exposition of the theory of minimal surfaces in Euclidean space with an emphasis on complete minimal surfaces of finite total curvature Our exposition is based upon the philosophy that the study of finite total curvature complete minimal surfaces in R^3 in large measure coincides with the study of meromorphic functions and linear series on compact Riemann surfaces This philosophy is first indicated in the fundamental theorem of Chern and Osserman A complete minimal surface M immersed in R^3 is of finite total curvature if and only if M with its induced conformal structure is conformally equivalent to a compact Riemann surface M_g punctured at a finite set E of points and the tangential Gauss map extends to a holomorphic map $M_g \rightarrow P^2$ Thus a finite total curvature complete minimal surface in R^3 gives rise to a plane algebraic curve Let M_g denote a fixed but otherwise arbitrary compact Riemann surface of genus g A positive integer r is called a puncture number for M_g if M_g can be conformally immersed into R^3 as a complete finite total curvature minimal surface with exactly r punctures the set of all puncture numbers for M_g is denoted by $P(M_g)$ For example Jorge and Meeks JM showed by constructing an example g for each r that every positive integer r is a puncture number for the Riemann surface pl
