Australia Alistair Glen, Christopher Dickman, 2014-11-05 The Australian continent provides a unique perspective on the evolution and ecology of carnivorous animals In earlier ages Australia provided the arena for a spectacular radiation of marsupial and reptilian predators The causes of their extinctions are still the subject of debate Since European settlement Australia has seen the extinction of one large marsupial predator the thylacine another the Tasmanian devil is in danger of imminent extinction and still others have suffered dramatic declines By contrast two recently introduced predators the fox and cat have been spectacularly successful with devastating impacts on the Australian fauna **Carnivores of Australia Past Present and Future** explores Australia s unique predator communities from pre historic historic and current perspectives It covers mammalian reptilian and avian carnivores both native and introduced to Australia It also examines the debate surrounding how best to manage predators to protect livestock and native biodiversity Readers will benefit from the most up to date synthesis by leading researchers and managers in the field of carnivore biology By emphasising Australian carnivores as exemplars of flesh eaters in other parts of the world this book will be an important reference for researchers wildlife managers and students worldwide **Managing Australia's Pest Animals** Mike Braysher, 2017-02 Pest animals are but

Cats in Australia Chris Dickman, John Woinarski, Sarah Legge, 2019-06-01 Across the world cats are loved as pets or are kept or tolerated for their role in controlling some animal pests But cats both pets and feral also kill many native animals and this toll can be enormous Cats have been remarkably successful in Australia spreading pervasively across the continent and many islands occurring in all environments and proving to be adept and adaptable hunters A large proportion of Australia's distinctive fauna is threatened and recent research highlights the significant role that cats play in the decline and extinction of native species Cats in Australia brings this research together documenting the extent to which cats have subverted and are continuing to subvert Australia's biodiversity But the book does much more than spotlight the impacts of cats on Australian nature It describes the origins of cats and their global spread their long standing and varying relationship with people their global impacts and their ecology It also seeks to describe the challenge of managing cats and the options available to constrain their impacts

The Action Plan for Australian Mammals 2012 Andrew Burbidge, John Woinarski, Peter Harrison, 2014-06-02 The Action Plan for Australian Mammals 2012 is the first review to assess the conservation status of all Australian mammals It complements The Action Plan for Australian Birds 2010 Garnett et al 2011 CSIRO Publishing and although the number of Australian mammal taxa is marginally fewer than for birds the proportion of endemic extinct and threatened mammal taxa is far greater These authoritative reviews represent an important foundation for understanding the current status fate and future of the nature of Australia This book considers all species and subspecies of Australian mammals including those of external territories and territorial seas For all the mammal taxa about 300 species and subspecies considered Extinct Threatened Near Threatened or Data Deficient the size and trend of their population is presented along with information on geographic range and trend and relevant biological and ecological data The book also presents the current conservation status of each taxon under Australian legislation what additional information is needed for managers and the required management actions Recovery plans where they exist are evaluated The voluntary participation of more than 200 mammal experts has ensured that the conservation status and information are as accurate as possible and allowed considerable unpublished data to be included All accounts include maps based on the latest data from Australian state and territory agencies from published scientific literature and other sources The Action Plan concludes that 29 Australian mammal species have become extinct and 63 species are threatened and require urgent conservation action However it also shows that where guided by sound knowledge management capability and resourcing and longer term commitment there have been some notable conservation success stories and the conservation status of some species has greatly improved over the past few decades The Action Plan for

Australian Mammals 2012 makes a major contribution to the conservation of a wonderful legacy that is a significant part of Australia's heritage. For such a legacy to endure, our society must be more aware of and empathetic with our distinctively Australian environment and particularly its marvellous mammal fauna. Relevant information must be readily accessible. Environmental policy and law must be based on sound evidence. Those with responsibility for environmental management must be aware of what priority actions they should take. The urgency for action and consequences of inaction must be clear and the opportunity for hope and success must be recognised. It is in this spirit that this account is offered.

Sustainable Planet Barbara J. McNicol, 2021-04-26 Sustainable Planet is a two volume resource that provides comprehensive coverage on the world's most pressing environmental issues, their impact in countries around the world and how or if they are being addressed. Sustainable Planet: Issues and Solutions for Our Environment's Future examines contemporary challenges to sustainability including population, climate change, decreasing biodiversity, land degradation and water quality. Each chapter analyzes one of these challenges by first providing an introduction to the topic as well as key concepts to provide readers with a basic understanding of the issue. Essays deepen comprehension by investigating different aspects of the challenge. Case studies written by experts in the field follow. Each case study considers how a specific country is affected by the particular issue as well as the measures the country is taking to find solutions that will provide for a more sustainable future. The final chapter of the book explores sustainability at a global level by examining through annotated primary documents a number of multinational initiatives and alliances intended to create a more sustainable planet.

Quantifying Diets of Wildlife and Fish Michael C.

Calver, Neil R. Loneragan, 2024-05-01 Quantifying Diets of Wildlife and Fish presents different techniques available to study animal diets Ecologists determine animal diets to build natural history knowledge test hypotheses in ecological theory and make informed management decisions for important ecosystems Many researchers use techniques traditionally applied to the animals they study rather than techniques with the greatest potential for the aims of each project In an effort to encourage researchers to consider new approaches this book focuses on the techniques rather than on particular groups of organisms or specific environments With contributions from leading ecologists chapters explore experimental design observational techniques including new technologies stomach contents and faecal analysis eDNA tracers and stable isotopes They also cover the latest multivariate methods of analyses suitable for describing animal diets and feeding relationships as well as testing hypotheses relevant to ecological theory environmental management and biological conservation The expert knowledge provided will encourage readers to look beyond the boundaries of their specialties assist in testing important hypotheses and provide insights into management problems The examples in this book cover a range of vertebrates and invertebrates as well as different environments to open these methods up for novice ecologists and stimulate lateral thinking in more experienced researchers

Invasion Biology and Ecological Theory

Herbert H. T. Prins, Iain J. Gordon, 2014-01-23 Many conservationists argue that invasive species form one of the most important threats to ecosystems the world over often spreading quickly through their new environments and jeopardising the conservation of native species As such it is important that reliable predictions can be made regarding the effects of new species on particular habitats This book provides a critical appraisal of ecosystem theory using case studies of biological invasions in Australasia Each chapter is built around a set of eleven central hypotheses from community ecology which were mainly developed in North American or European contexts The authors examine the hypotheses in the light of evidence from their particular species testing their power in explaining the success or failure of invasion and accepting or rejecting each hypothesis as appropriate The conclusions have far reaching consequences for the utility of community ecology suggesting a rejection of its predictive powers and a positive reappraisal of natural history
