

Pre-lab 1: Rotational Equilibrium and Torque

1. Experimental Objectives

- Understand torque as a vector and apply it to rotational equilibrium
- Investigate rotational equilibrium experimentally at three points without rotation
- Understand torque as a vector (non-scalar) aspect of the 3-vector analysis
- Develop the skills to calculate torque components of the forces

2. Background

Considered in the previous lab, rotational equilibrium is a vector analysis. The vector and scalars are the conditions on vector quantities. This lab focuses on applying the conditions to specific vectors. Specifically, we will investigate the conditions on the components of the forces. It is also in this lab where the idea of identifying a point of rotation is introduced and its relevance to the experiment is discussed. The experiment will involve a horizontal beam with a fulcrum at its center and a series of weights and masses hanging from it.

Rotational equilibrium is a condition that requires the sum of the torques on a system to be zero. In this experiment, we will investigate the conditions on the components of the forces. It is also in this lab where the idea of identifying a point of rotation is introduced and its relevance to the experiment is discussed. The experiment will involve a horizontal beam with a fulcrum at its center and a series of weights and masses hanging from it.

In addition, this lab will involve a series of experiments. The first experiment will involve a horizontal beam with a fulcrum at its center and a series of weights and masses hanging from it. The second experiment will involve a horizontal beam with a fulcrum at its center and a series of weights and masses hanging from it. The third experiment will involve a horizontal beam with a fulcrum at its center and a series of weights and masses hanging from it.

Oxygen therapy is a treatment that provides a patient with extra oxygen to breathe in. It is also called supplemental oxygen. It is only available through a prescription from a health care provider. Patients may receive it in hospital, another medical setting, or at home. Some people only need it for a short period of time. Others will need long-term oxygen therapy. There are different types of devices that can provide oxygen. Some use tanks of liquid or gas oxygen. Others use an oxygen concentrator which pulls oxygen out of the air. The oxygen is administered through a nose tube, cannula, a mask, or a tent. The extra oxygen is breathed in along with normal air. This book is a concise guide to oxygen therapy for clinicians and trainees. Divided into four sections, the text begins with an overview of the basic facts of oxygen, describing the different types and their individual uses in clinical therapy. Section two discusses the physiology and monitoring of oxygen therapy, and section three covers different devices and delivery systems and oxygen toxicity, lung damage from breathing in too much extra oxygen. The final section examines oxygen targets in disease, specifics how the therapy works, and the effects of hypoxia, low oxygen levels in body tissues, and hypoxemia, low oxygen levels in the blood.
