Frailty Models In Survival Analysis Chapman And Hall Or Crc Biostatistics Series:

Frailty Models in Survival Analysis Andreas Wienke, 2010-07-26 The concept of frailty offers a convenient way to introduce unobserved heterogeneity and associations into models for survival data In its simplest form frailty is an unobserved random proportionality factor that modifies the hazard function of an individual or a group of related individuals Frailty Models in Survival Analysis presents a comprehensive overview of the fundamental approaches in the area of frailty models The book extensively explores how univariate frailty models can represent unobserved heterogeneity It also emphasizes correlated frailty models as extensions of univariate and shared frailty models The author analyzes similarities and differences between frailty and copula models discusses problems related to frailty models such as tests for homogeneity and describes parametric and semiparametric models using both frequentist and Bayesian approaches He also shows how to apply the models to real data using the statistical packages of R SAS and Stata The appendix provides the technical mathematical results used throughout Written in nontechnical terms accessible to nonspecialists this book explains the basic ideas in frailty modeling and statistical techniques with a focus on real world data application and interpretation of the results By applying several models to the same data it allows for the comparison of their advantages and limitations under varying model assumptions The book also employs simulations to analyze the finite sample size performance of the models

Exploring Studbooks for Wildlife Management and Conservation F.P.G. Princée, 2016-12-20 Many endangered species of wild animals are managed in captivity through studbooks In this book these data rich resources are mined in innovative integrated and statistically tested ways to maximise information gain for conservation practice whether for captive or released reintroduced or managed wild populations This book is thus an important tool for all species managers and for students and researchers in small population biology and wildlife conservation The book's studbook analyses are grouped in three interrelated sections natural history demography and genetics Statistical tests to determine the significance of results or to compare results between subgroups are undertaken throughout Real studbooks of a variety of species e.g. cranes wolverines blesbok illustrate the practical applications and interpretations of the analyses and statistics The natural history section presents analyses to determine baseline species information such as litter size inter birth interval longevity and seasonality Demography covers census style analyses age class based life tables comparative survival analyses and population projections Solutions for dealing with small sample sizes are included Inbreeding depression and unconscious selection form the main focus of the genetics section Survival and life table analyses are used to assess inbreeding effects Quantitative genetics methods are applied to natural history traits as a tool to monitor genetic variation A fourth section on conservation shows how data from captive populations can be used where natural history data from wild populations are missing A real example uses studbook data to inform Population Viability Analysis The final section deals with issues related to incomplete and missing data and statistical topics The purpose written open source software programs Population

Mixed Effects Models for the Population Approach Marc Lavielle, 2014-07-14 Wide Ranging Coverage of Parametric Modeling in Linear and Nonlinear Mixed Effects Models. Mixed Effects Models for the Population Approach: Models, Tasks, Methods, and Tools presents a rigorous framework for describing, implementing, and using mixed effects models. With these models, readers can perform parameter estimation and modeling across a whole population of individuals at the same time. Easy to Use Techniques and Tools for Real World Data Modeling. The book first shows how the framework allows model representation for different data types including continuous, categorical, count, and time to event data. This leads to the use of generic methods such as the stochastic approximation of the EM algorithm, SAEM, for modeling these diverse data types. The book also covers other essential methods including Markov chain Monte Carlo, MCMC, and importance sampling techniques. The author uses publicly available software tools to illustrate modeling tasks. Methods are implemented in Monolix, and models are visually explored using Mlxplore and simulated using Simulx. Careful Balance of Mathematical Representation and Practical Implementation. This book takes readers through the whole modeling process from defining, creating a parametric model to performing tasks on the model using various mathematical methods. Statisticians and mathematicians will appreciate the rigorous representation of the models and theoretical properties of the methods, while modelers will welcome the practical capabilities of the tools. The book is also useful for training and teaching in any field where population modeling occurs.
