Cell Cycle In Development Results And Problems In Cell Differentiation:

Cell Cycle in Development Jacek Z. Kubiak, 2011-06-01 This book focuses on the intersection between cell cycle regulation and embryo development Specific modifications of the canonical cell cycle occur throughout the whole period of development and are adapted to fulfil functions coded by the developmental program Deciphering these adaptations is essential to comprehending how living organisms develop The aim of this book is to review the best known modifications and adaptations of the cell cycle during development The first chapters cover the general problems of how the cell cycle evolves while consecutive chapters guide readers through the plethora of such phenomena The book closes with a description of specific changes in the cell cycle of neurons in the senescent human brain Taken together the chapters present a panorama of species from worms to humans and of developmental stages from unfertilized oocyte to aged adult *Results and Problems in Cell Differentiation* W. Beermann, 1968

Asymmetric Cell Division in Development, Differentiation and Cancer Jean-Pierre Tassan, Jacek Z. Kubiak, 2017-04-12 This book provides readers with an overview of the frequent occurrence of asymmetric cell division Employing a broad range of examples it highlights how this mode of cell division constitutes the basis of multicellular organism development and how its misregulation can lead to cancer To underline such developmental correlations readers will for example gain insights into stem cell fate and tumor growth In turn subsequent chapters include descriptions of asymmetric cell division from unicellular organisms to humans in both physiological and pathological conditions The book also illustrates the importance of this process for evolution and our need to understand the background mechanisms offering a valuable guide not only for students in the field of developmental biology but also for experienced researchers from neighboring fields

Cell Cycle and Cell Differentiation J. Reinert, H. Holtzer, 2013-06-29 It is instructive to compare the response of biologists to the two themes that comprise the title of this volume The concept of the cell cycle in contrast to cell division is a relatively recent one Nevertheless biologists of all persuasions appreciate and readily agree on the central problems in this area Issues ranging from mechanisms that

initiate and integrate the synthesis of chromosomal proteins and DNA during S phase of mitosis to the manner in which assembly of microtubules and their interactions lead to the segregation of metaphase chromosomes are readily followed by botanists and zoologists as well as by cell and molecular biologists. These problems are crisp and well defined. The current state of cell differentiation stands in sharp contrast. This one of the oldest problems in experimental biology almost defies definition today. The difficulties arise not only from a lack of pertinent information on the regulatory mechanisms but also from conflicting basic concepts in this field. One of the ways in which this situation might be improved would be to find a broader experimental basis including a better understanding of the relationship between the cell cycle and cell differentiation.

The Cell Cycle Valerie W. Hu, 2012-12-06 Interest in the cell cycle has grown explosively in recent years as a result of the identification of key cell cycle regulators and their substrates. Aside from enhancing our understanding of normal cellular growth controls, this new knowledge has also been valuable in elucidating mechanisms of growth deregulation which occur in diseased states such as cancer and in some instances viral or parasitic infections. The Thirteenth Washington International Spring Symposium was organized with the intention of bringing together scientists working on different aspects of the cell cycle. Scientific topics presented ranged from molecular regulators and effectors to mitosis, specific changes in cell architecture to the role of the cell cycle in development and disease. The goal of this gathering was to help formulate a more comprehensive and integrated picture of events driving and being driven by the cell cycle as well as to evaluate the possibilities for clinical application of this knowledge. This symposium held in Washington D C from May 10-14, 1993 was attended by more than 400 scientists from 20 countries including many of the scientific leaders in this field. This volume contains most of the papers presented at the seven plenary sessions in addition to selected contributions from a total of nine special oral and poster sessions.

Genetic Mosaics and Cell Differentiation W. J. Gehring, 2013-06-29 The relationship of cell lineage and differentiation is one of the most intriguing problems in developmental biology. In most higher organisms the analysis of the cell lineage has to rely on indirect methods. Only in the most suitable systems like the nematodes can the pattern of cell division be determined by direct observation under the microscope. In cases where this is not possible the fate of the cells has to be examined by using cell markers. Most suitable for this purpose are genetic markers provided that they do not interfere with the developmental pathway to be studied. However, suitable genetic markers and techniques for generating genetic mosaics are available in a few organisms only. Therefore this volume is largely concerned with *Drosophila* and the mouse which have been studied most extensively. In 1929 STURTEVANT introduced the analysis of gynandromorphs into developmental genetics. However, this important contribution remained largely unnoticed until the late sixties when the potential of this technique for determining embryonic fate maps and the number of primordial cells was exploited and the methodology extended to the mapping of mutational foci. Mitotic recombination was demonstrated by STER
