

# Cell Cycle Regulation

How does a cell know it is time to divide?

## Why?

Quality control inspectors typically do not limit their product testing to the final product at the end of the assembly line. They monitor all aspects of production in hopes of preventing larger problems down the line. Likewise, when cells are progressing through the cell cycle there are processes in place that check on the cell's progress. Is everything happening according to plan? Are there sufficient resources to complete the task of cell division? Tightly regulating the cell cycle keeps a multicellular organism healthy by conserving materials. This ensures that new cells receive accurate genetic information, and also prevents uncontrolled growth that may lead to diseases like cancer.

## Model 1 – The Cell Cycle

1. Review the phases of the cell cycle in Model 1 by placing the abbreviated phase name ( $G_1$ ,  $S$ ,  $G_2$ , or  $M$ ) next to the proper description.

<u><math>G_1</math></u>	The cell grows by producing more proteins and organelles.
<u><math>S</math></u>	DNA replication occurs.
<u><math>G_2</math></u>	The cell prepares for cell division with the appearance of centrosomes.
<u><math>M</math></u>	Mitosis and cytokinesis occurs.

2. Some cells, like mature nerve cells or muscle cells, do not divide. Other cells will divide only when the cellular environment signals that it is necessary. According to Model 1, what "phase" of the cell cycle are these cells said to be in when they are not dividing or planning to divide?

According to Model 1, the  $G_0$  phase of the cell cycle is where those cells are located in when they are not dividing or planning to divide.

### **Roles of Cell Cycle Regulation in Female**

**Reproduction: Analysis of the Cdk4-null Mouse** David S. Moons, 2007 In order to identify unique roles for Cdk4 mice deficient for this protein were created Analysis of these mutant mice revealed tissue specific defects including female infertility Cdk4 deficient mice display defects that affect tissue function in not only the ovary and uterus but also the pituitary Analysis of the pituitary in Cdk4 null mice indicated anterior pituitary hypoplasia specific to the Pit1 dependent cell lineages Hypoproliferation was also observed in lactotrophs of adult Cdk4 null female mice in response to estrogen The role of Cdk4 in the ovary is distinct from that of its partner cyclin D2 in that Cdk4 is dispensable for granulosa cell proliferation while cyclin D2 is critical for this process Intriguingly similar to cyclin D2 null mice Cdk4 null mice display oocytes entrapped in differentiated corpora lutea suggesting a unique role for cyclin D2 Cdk4 in the process of ovulation Cdk4 null mice also display luteal insufficiency that appears to be secondary to defective PRL secretion resulting from the pituitary hypoplasia since injection of Cdk4 null mice with exogenous PRL restored progesterone to wild type levels Analysis of the uterus indicates a rate limiting role of Cdk4 in endometrial stromal cell proliferation during the process of decidualization Although embryo implantation does not occur in Cdk4 deficient mice under normal conditions this appears to be the result of luteal insufficiency since injection of either progesterone or prolactin results in implantation in Cdk4 null mice The data presented in this thesis indicate that Cdk4 plays unique roles in various processes involved in female reproduction The female infertility appears to be the result of lactotroph hypoplasia that results in luteal failure thereby preventing implantation of the embryo
