## **Geochemistry Of Marine Sediments:**

*Geochemistry of Marine Sediments* David J. Burdige, 2020-07-21 The processes occurring in surface marine sediments have a profound effect on the local and global cycling of many elements This graduate text presents the fundamentals of marine sediment geochemistry by examining the complex chemical biological and physical processes that contribute to the conversion of these sediments to rock a process known as early diagenesis Research over the past three decades has uncovered the fact that the oxidation of organic matter deposited in sediment acts as a causative agent for many early diagenetic changes Summarizing and discussing these findings and providing a much needed update to Robert Berner's Early Diagenesis A Theoretical Approach David J Burdige describes the ways to quantify geochemical processes in marine sediment By doing so he offers a deeper understanding of the cycling of elements such as carbon nitrogen and phosphorus along with important metals such as iron and manganese No other book presents such an in depth look at marine sediment geochemistry Including the most up to date research a complete survey of the subject explanatory text and the most recent mathematical formulations that have contributed to our greater understanding of early diagenesis *Geochemistry of Marine Sediments* will interest graduate students of geology geochemistry and oceanography as well as the broader community of earth scientists It is poised to become the standard text on the subject for years to come *Marine Geochemistry* Horst D. Schulz, Matthias Zabel, 2006-07-02 Since 1980 a considerable amount of scientific research dealing with geochemical processes in marine sediments has been carried out This textbook summarizes the state of the art in this field of research The topics comprise the examination of sedimentological and physical properties of the sedimentary solid phase of pore water and pore water constituents organic matter as the driving force of most microbiological processes biotic and abiotic redox reactions carbonates and stable isotopes as proxies for paleoclimate reconstruction metal enrichments in ferromanganese nodules and crusts as well as in hot vents and cold seeps on the seafloor A new chapter describes properties occurrence and formation of gas hydrates in marine sediments The textbook ends with a chapter on model conceptions and computer models to quantify processes of early diagenesis *Geochemistry of Marine Sediments* Aiden Williams, 2025-08-25 The geochemistry of marine sediments involves the study of the chemical composition and processes affecting the sediments found on the ocean floor These sediments are derived from various sources including terrestrial material transported by rivers biogenic particles from marine organisms volcanic ash and extraterrestrial particles The composition of marine sediments is influenced by factors such as the productivity of marine life ocean currents and climatic conditions Marine sediments are categorized into terrigenous biogenic hydrogenous and cosmogenic sediments Terrigenous sediments are primarily composed of clays and silts derived from land erosion while biogenic sediments consist mainly of calcium carbonate and silica from the remains of marine organisms like foraminifera and diatoms Hydrogenous sediments form from the precipitation of dissolved minerals in seawater such as manganese nodules Cosmogenic sediments though minor in quantity

originate from space Chemical interactions between these sediments and seawater play a crucial role in the global cycling of elements such as carbon nitrogen and sulfur Diagenetic processes occurring within the sediment layers further alter the original composition through microbial activity chemical reactions and physical changes This book is a valuable compilation of topics ranging from the basic to the most complex advancements in the field of geochemistry This book presents the complex subject of geochemistry in the most comprehensible and easy to understand language Students researchers experts and all associated with this subject will benefit alike from this book Marine Geochemistry Roy Chester, 2012-12-06 The past two or three decades have seen many important advances in our knowledge of the chemistry physics geology and biology of the oceans It has also become apparent that in order to understand the manner in which the oceans work as a chemical system it is necessary to use a framework which takes account of these interdisciplinary advances Marine geochemistry has been written in response to the need for a single state of the art text that addresses the subject of treating the sea water sediment and rock reservoirs as a unified system In taking this approach a process orientated framework has been adopted in which the emphasis is placed on identifying key processes operating within the unified ocean In doing this particular attention has been paid to making the text accessible to students from all disciplines in such a way that future advances can readily be understood I would like to express my thanks to those people who have helped with the writing of this volume In particular I wish to put on record my sincere appreciation of extremely helpful suggestions made by Professor John Edmond FRS In addition I thank Dr S Rowlett for his comments on the sections covering the geochemistry of oceanic sediments and Dr G Wolff for his invaluable advice on the organic geochemistry of biota water and sediments It is a great pleasure to acknowledge the help of Dr K J T *Sediments, Diagenesis, and Sedimentary Rocks* Fred T. Emelyanov,K.M. Shimkus,2012-12-06 The monograph presented to foreign readers has been prepared by the famous Soviet investigators of processes of geochemistry and sedimentation in the Mediterranean Sea For more than 20 years E M Emelyanov has

examined the recent sedimentation of the Mediterranean Sea and K M Shimkus has studied the Quaternary and the earlier sedimentation of the area. The authors, scientific workers from the P P Shirshov Institute of Oceanology USSR Academy of Sciences Atlantic and Southern Departments, took part not only in numerous cruises on oceanographic vessels of the USSR but in the study of cores of the deep sea drilling on R V Glomar Challenger. A great number of scientific papers and some books devoted to the processes of sedimentation and geochemistry of the Mediterranean Sea were written by them. Although the scientific interests of the authors are not only limited to these questions, I should like to emphasise these aspects of their scientific activity when introducing this book. The Mediterranean Sea is a suitable natural laboratory for solving a number of principal problems of marine sedimentation and lithogenesis.

**Sedimentology and Geochemistry of Marine Sediments Near Comox, British Columbia** John J. Clague, 1976. The estuarine environment is important both scientifically and economically: the former because of complex physiochemical and biological interactions resulting from the introduction of fresh water into a semi-enclosed body of sea water; the latter because estuaries are directly or indirectly utilized in furtherance of man's activities. The environment of an estuary is controlled by many factors, some of the more important of which are the morphology, physical oceanography and biota of the estuarine basin, sediment and water discharge characteristics of inflowing rivers, composition and texture of rocks and subaerial sediments adjacent to the estuary and the amount and character of chemical and organic wastes introduced as a result of industrial and urban activities.

**Chemical Oceanography and the Marine Carbon Cycle** Steven Emerson, John Hedges, 2008-04-24. The principles of chemical oceanography provide insight into the processes regulating the marine carbon cycle. The text offers a background in chemical oceanography and a description of how chemical elements in seawater and ocean sediments are used as tracers of physical, biological, chemical and geological processes in the ocean. The first seven chapters present basic topics of thermodynamics, isotope systematics and carbonate chemistry and explain the influence of life on ocean chemistry and how it has evolved in the recent glacial-interglacial past. This is followed by topics essential to understanding the carbon cycle, including organic geochemistry, air-sea gas exchange, diffusion and reaction kinetics, the marine and atmosphere carbon cycle and diagenesis in marine sediments. Ideal as a textbook for upper level undergraduates and graduates in oceanography, environmental chemistry, geochemistry and earth science and a valuable reference for researchers in oceanography.
